1.0 INTRODUCTION

1.1 Statutory Authority and Requirements

SDCF Monterey Park, LLC (the "Applicant") submitted an application for a data center project at 1977 Saturn Street, Monterey Park, CA to the City of Monterey Park Planning Division for discretionary review. The City of Monterey Park ("City"), as Lead Agency, determined that the proposed project is subject to the California Environmental Quality Act ("CEQA"), and that preparation of an initial study is required.

This initial study ("IS") evaluates the potential environmental effects that could result from the construction and operation of the proposed data center. This IS has been prepared in accordance with California Public Resources Code section 21000 et seq. ("CEQA") and Title 14 of the California Code of Regulations Section 15000, et. seq. ("CEQA Guidelines").

Based on the analysis provided within this IS, the City concluded that, with incorporation of the identified mitigation as agreed to by the Applicant, the proposed data center would not result in significant impacts on the environment and, therefore, that the preparation of a mitigated negative declaration ("MND") is intended as an informational document and is ultimately required to be adopted by the City's decision-making body before or concurrently with the proposed project.

1.2 Summary of Findings

Pursuant to CEQA Guidelines section 15367, the City, as Lead Agency, has the authority for environmental review and adoption of the environmental documentation, in accordance with CEQA. This IS and MND evaluated the environmental issues outlined in **Section 3.0: Environmental Factors Potentially Affected**. It provides decision-makers and the public with information concerning the proposed project's potential environmental effects and recommended mitigation measures, if any.

Based on this IS and MND, and supporting environmental analysis, the proposed project would have no impact or a less than significant impact concerning all environmental issue areas, except the following, for which the proposed project would have a less than significant impact with mitigation incorporated:

- Cultural Resources
- Geology and Soils
- Hazards and Hazardous Materials
- Tribal Cultural Resources

As set forth in CEQA Guidelines Section 15070, an initial study leading to a mitigated negative declaration can be prepared when the initial study identifies potentially significant effects, but project revisions would avoid or mitigate the effects to a point where clearly no significant effects would occur, and there is no substantial evidence, in light of the whole record before the agency, that the project as revised may have a significant effect on the environment.

1.3 Initial Study Public Review Process

The Notice of Intent to Adopt a Mitigated Negative Declaration ("NOI") was provided to the Clerk of the County of Los Angeles and mailed to responsible and trustee agencies concerned with the proposed project and other public agencies with jurisdiction by law over resources affected by the project. A 30-day public review period has been established for the IS/MND in accordance with CEQA Guidelines Section 15073. During the public review period, the IS/MND, including the Technical Appendices, was made available for review on the City website, at https://www.montereypark.ca.gov/241/Planning.

In reviewing the IS/MND, affected public agencies and the interested public should focus on the document's adequacy in identifying and analyzing the potential environmental impacts and the ways in which the Project's potentially significant effects can be avoided or mitigated.

Written comments on this IS/MND may be sent to:

Beth Chow, AICP, Planning Manager
City of Monterey Park, Planning Division
320 West Newmark Ave
Monterey Park, CA 91754
Email: bchow@MontereyPark.ca.gov

Following receipt and evaluation of comments from agencies, organizations, and/or individuals, the City will determine whether any substantial new environmental issues have been raised. If so, further documentation may be required. If not or if the issues raised do not provide substantial evidence that the Project would have a significant effect on the environment, the IS/MND will be considered for adoption and the Project for approval.

1.4 Incorporation by Reference

Pursuant to CEQA Guidelines Section 15150, an initial study and mitigated negative declaration may incorporate by reference all, or portions of, another document which is a matter of public record or is generally available to the public. Where all or part of another document is incorporated by reference, the incorporated language is considered set forth in full as part of the initial study and mitigated negative declaration's text.

The references outlined below, which were utilized during preparation of the IS, are available for review on the City's website, at:

Monterey Park General Plan. The City adopted its comprehensive General Plan ("General Plan") in 2001. Since adopting the General Plan, the General Plan's Land Use and Urban Design Element was adopted through the Focused General Plan Update in June 2020, the Healthy Communities Element and Sustainable Communities Element were adopted in October 2014, the Safety Element and Environmental Justice Element were adopted in January 2022, and the 2021-2029 Housing Element (6th Cycle) was adopted in March 2023. The General Plan outlines the City's goals, plans, and objectives for land use within the City's jurisdiction.

Found at: https://www.montereypark.ca.gov/253/General-Plan

Monterey Park Municipal Code ("MPMC"). The MPMC, among other things, implements the General Plan and regulates land use and development within the City's jurisdiction. MPMC Title 21 is the primary tool for implementing the General Plan and coordinating and controlling the development and use of real property throughout the City. The MPMC is referenced throughout this IS/MND to establish the Project's baseline regulatory requirements.

1.5 Report Organization

This document is organized into the following sections:

Section 1.0: Introduction provides a project introduction and overview, cites the CEQA Guidelines to which the proposed project is subject, and summarizes the IS/MND's conclusions.

Section 2.0: Project Description details the Project's location, environmental setting, background and history, characteristics, discretionary actions, construction program, phasing, agreements, and required permits and approvals. This section also identifies the IS/MND's intended uses, including a list of anticipated permits and other approvals.

Section 3.0: Lead Agency Determination provides the determination of the proposed project and an overview of potential impacts that may or may not result from project implementation.

Section 4.0: Evaluation of Environmental Impacts provides an analysis of environmental impacts identified in the environmental checklist.

This page intentionally left blank.

2.0 PROJECT DESCRIPTION

2.1 Project Overview

The Applicant proposes to demolish the existing improvements on the real property located at 1977 Saturn Street, Monterey Park CA and construct a new data center with an ancillary equipment yard, substation, parking, and landscaping. The proposed data center would comprise a total of approximately 218,400 square feet that would include approximately 109,970 square feet of data hall space and approximately 91,889 square feet of support space (collectively, the "Project").

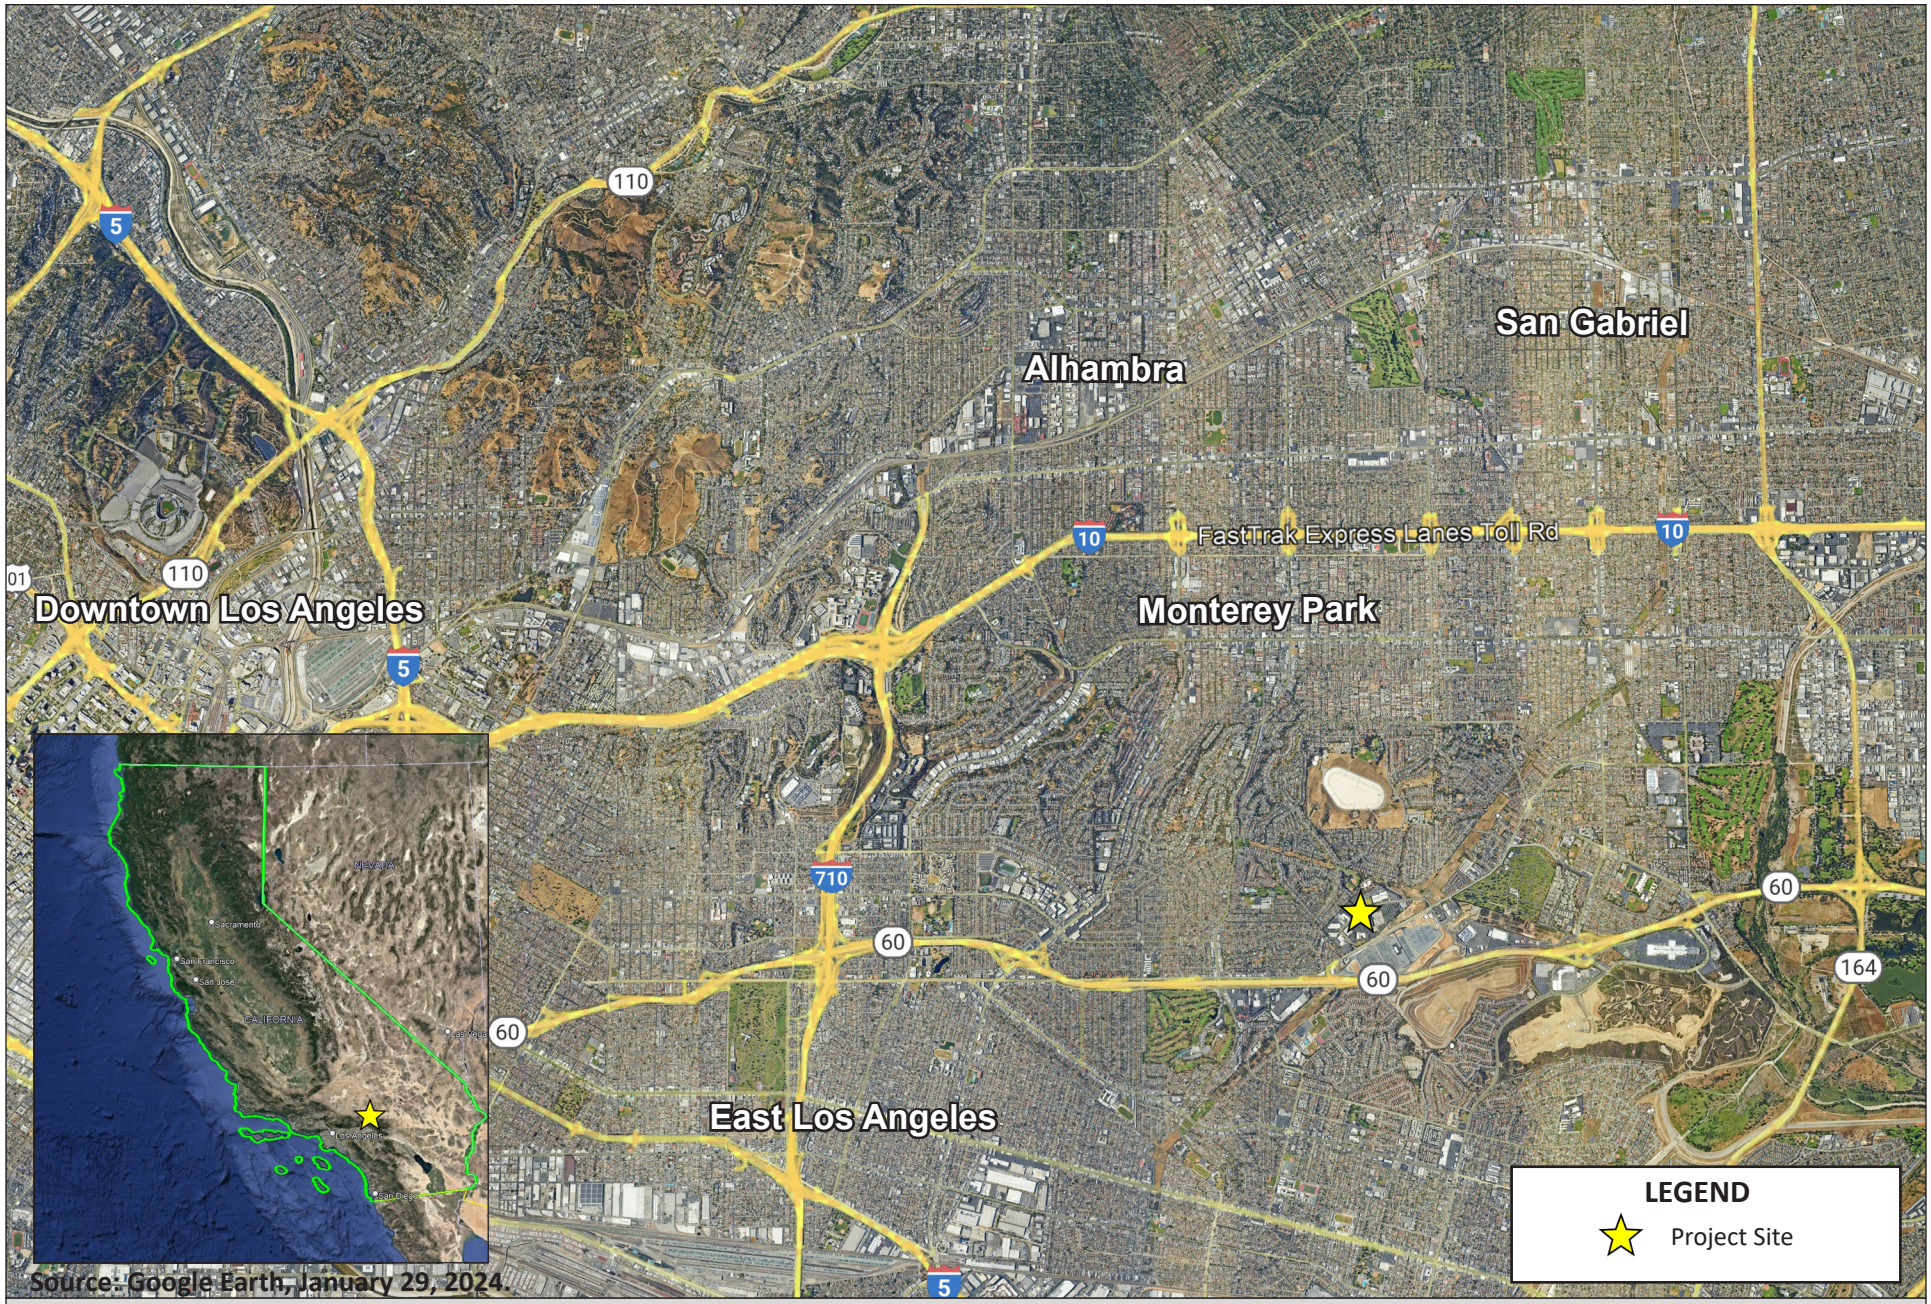
The data center building's support space would consist of office, loading docks, storage, mechanical/electrical/fiber entry rooms, and other ancillary uses. The proposed data center building would have an FAR of 0.32.

The preliminary design of the proposed data center building would be one story and 36 feet in height (46.5 feet to top of mechanical equipment platform screening). The proposed data center would house computer servers and supporting equipment for private clients. Clients would either use the Project as a place to relocate their existing servers or as a place to operate new servers and expand their server capacity. Power to run data center operations would be provided by Southern California Edison ("SCE") service, through a proposed on-site dedicated 24,000-square-foot electrical substation to be constructed on the northeastern portion of the site. To provide power during an interruption in SCE service, the Applicant would also install 14 stationary diesel-fueled internal combustion engines and generators ("gen-sets"). The 14 gen-sets, each capable of producing four megawatts ("MW"), would be used only in the event of an emergency. The maximum power demand to maintain full functionary of the data center is calculated to be approximately 49.9 MW, which could be produced by 12 of the gen-sets, allowing 2 gen-sets to be a redundant back-up. Twelve four MW backup generators with a total generation capacity of up to 48 MW and the two redundant back-up generators would be located outdoors in an approximately 75,000-square-foot ancillary equipment yard, adjacent to the north side of the data center. The ancillary equipment yard would be screened by a 20-foot tall perforated screen wall. Rooftop mechanical equipment would be required to provide interior temperature control and to cool computer servers. The substation would also include fire safety equipment.

Additional on-site improvements would include a trash enclosure, gated driveway access, parking lot, perimeter fencing, masonry wall on the northwestern portion of the site, retaining wall along the northeasterly and southwesterly site boundary on Orange Avenue and Saturn Street, respectively, and landscaping, as further described below.

2.2 Location

The Project is proposed on the real property located at 1977 Saturn Steet, Monterey Park CA (Assessor's Parcel Number ("APN") 5265-026-054) which is approximately 15.8 acres, and is located in the southeastern portion of the City, in Los Angeles County ("County"), approximately 7.5 miles east of downtown Los Angeles (the "Project Site"); see **Figures 2-1: Regional Vicinity**



Map and **2-2: Local Vicinity Map**. Regional access to the Project Site is provided via State Route 60 ("SR 60"), Interstate 10 ("I-10"), State Route 164 ("SR 164"), and Interstate 710 ("I-710"), located approximately 0.4-mile south, 2.1 miles north, 2.8 miles east, 3.1 miles west of the Project Site, respectively.

2.3 Environmental Setting

2.3.1 On-Site Conditions

The majority of the Project Site is relatively flat, except for the northern boundary of the Project Site which moderately slopes up to a small hill that borders the northern boundary of the Project Site. Project Site elevations range from approximately 360 feet above mean sea level ("amsl") to approximately 420 amsl. As depicted in Figure 2-2, the Project Site is currently developed with a two-story commercial office building, an associated one-story utility building with a diesel-powered emergency backup generator, and surface parking lot. The existing buildings on-site were developed in 1979. The existing office commercial building was formerly occupied for use as a banking office and data center until 2016. Current on-site operations consist of routine general property management and maintenance. The commercial office building is approximately 205,628 square feet, and the utility building is approximately 3,936 square feet, resulting in a total existing building square footage of approximately 209,564 square feet. The Project Site also contains an asphalt-paved surface parking lot with 847 parking spaces and an existing perimeter security fence. Approximately 337 trees and landscaping are located along the western, northern, and eastern boundaries of the Project Site and throughout the parking lot. A grass area is also located adjacent to the western and southern sides of the commercial office building.

Access to the Project Site is provided via two driveways off Saturn Street, one each off the eastern and western boundaries of the Project Site. Pedestrian access is provided via an existing sidewalk along the portion of Saturn Street that abuts the southeastern portion of the existing commercial office building. The Project Site includes existing utility connections (water, sewer, and electrical).

2.3.2 General Plan And Zoning

The Project Site is within the McCaslin Business Park (O-P Voter Enacted) zone, and has a General Plan land use designation of Innovation/Technology. The primary uses allowed within this land use designation include research and development, light manufacturing, service commercial, professional offices, entertainment, and breweries/wineries/distilleries. Figure LU-4 in the General Plan's Land Use and Urban Design Element which identifies the Project Site within the Saturn Park Focus Area, which was developed to create new business opportunities within the district. The maximum allowable intensity in the Saturn Park Focus Area Innovation/Technology land use designation is 0.60 floor area ratio ("FAR") per Figure LU-4 in the Land Use Element with a maximum height of 40 feet, and identified as 0.80 FAR per MPMC Section 21.14.100.[1]

The Project Site is zoned Office Professional (Voter Enacted) (O-P). Pursuant to MPMC 21.14.040, principal permitted uses in this zone include data processing facilities. The O-P Zone is intended to provide for the development of integrated professional, office and limited retail areas that exhibit a diversity of business activity from both revenue and service quality standpoints, and which are compatible and responsive to abutting land uses, including residential developments.[2]

2.3.3 Surrounding Land Uses

On-site and surrounding land uses and zoning designations are summarized in **Table 2-1: On-site and Surrounding Land Uses** and depicted on Figure 2-2.

Table 2-1: On-site and Surrounding Land Uses

Description	Existing On-the-Ground[1]	Zoning[2]
Project Site	Commercial office building, parking lot	Office Professional (Voter Enacted) (O-P)
North	La Loma Reservoir water storage tanks, La Loma Park, plant nursery, single-family residential uses beyond	Open Space (O-S)
South	Saturn Street, commercial office buildings, surface parking lots, Southern California Edison (SCE) Mesa Substation	O-P
East	South Orange Avenue, open space	O-S, O-P
West	Commercial office buildings, single-family residential uses	O-P, Single-Family Residential (R-1)

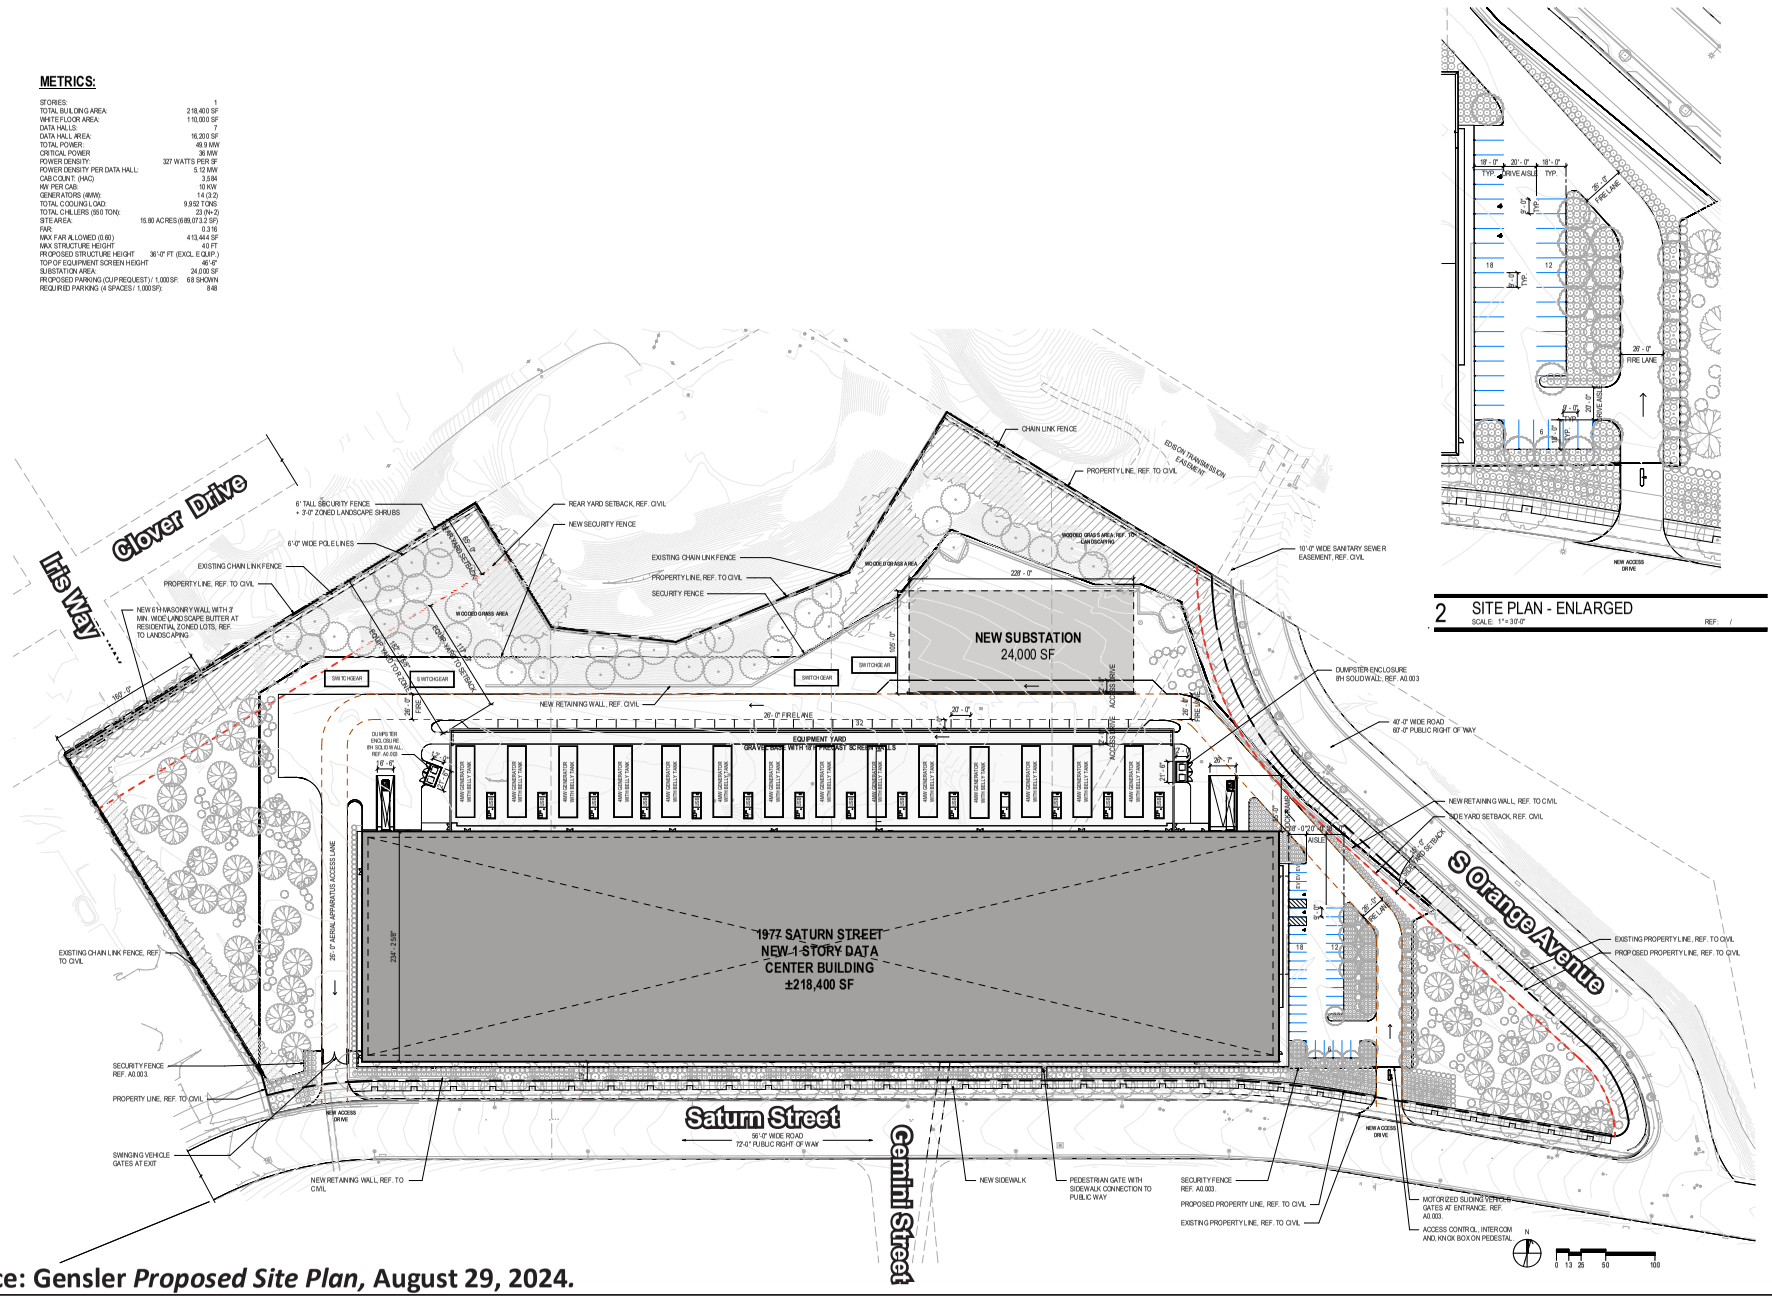
2.4 Project Characteristics

See **Figure 2-3: Conceptual Site Plan** for a conceptual site plan depicting the various components of the Project.

2.4.1 Major Equipment

Table 2-2: Major Equipment provides a list of the major equipment that would be located on the Project Site as part of the Project.

Table 2-2: Major Equipment



Equipment	Quantity	Location
4-MW standby generators	14	North of and adjacent to the data center
125-kW chillers	23	On the roof of the proposed building

2.4.2 Architectural Design

Exterior building elements and materials for the proposed data center would include metal panels, insulated precast concrete panels, aluminum-framed glass storefront with an aluminum canopy, aluminum-framed doors, and glazed windows. Rooftop equipment would be screened from view from the surrounding area by 16-foot-tall metal panel acoustic and visual screens, and the gen-sets in the equipment yard would be screened from view by an approximate 20-foot-tall perforated screen wall. Retaining walls would also enclose the loading yards, trash enclosure, and substation. The final architectural design of the proposed building is subject to review and approval by the City.

2.4.3 Access, Circulation, and Parking

The Project is required to provide 848 parking spaces per MPMC Table 21.22(c), Nonresidential Parking Standards, of Section 21.22.120, Minimum Parking Spaces Required. As further described in Section 2.6.3, Project Operations – Employees, below, up to 26 employees would typically work in the data center building throughout the day (daytime, evening, and overnight) every 24 hours. As the projected number of employees would require far fewer parking spaces than what is prescribed in the MPMC, the Project would provide for demand-based parking via a parking analysis reviewed by the City Engineer and City Planner to accommodate anticipated parking needs. Such parking needs would be incorporated into the development standards contained in the Business Recovery Development Agreement Zone ("BRDZ"). Accordingly, the Project would include 68 parking spaces adjacent to the eastern and northern sides of the proposed data center building, including three handicapped accessible spaces and three spaces for electric vehicles ("EV"). The Project would also include two loading dock berths to accommodate deliveries and loading activities for the proposed data center.

FIGURE 2-3: CONCEPTUAL SITE PLAN

1977 Saturn Data Center Project
Initial Study/Mitigated Negative Declaration

NOT TO SCALE

Kimley»Horn

This page intentionally left blank.

Vehicular access to the Project Site would be provided via two new gated driveways located along Saturn Street. One driveway is proposed to be located along the western perimeter of the Project Site, and the other driveway is proposed to be located along the eastern perimeter of the Project Site. These new driveways would be located closer to the western and eastern boundaries of the Project Site compared to the existing driveways. These two driveways would connect with each other along the northern side of the proposed equipment yard. The driveway along the eastern perimeter of the Project Site would serve as the main entry to the Project Site for passenger and service vehicles. Additionally, an internal, 26-foot-wide drive aisle would be included for general circulation and fire access. The designs and dimensions of the driveways would be designed to comply with the City's current design requirements.

Pedestrian access within the Project Site would also be provided via a walkway along the western, southern, and eastern sides of the data center. A pedestrian gate with sidewalk connection to the public right-of-way would be provided on Saturn Street west of the new eastern driveway.

2.4.4 Security and Fencing

The Project would include new security fencing enclosing the Project Site in addition to the existing perimeter fence. Two secured access gates would be provided, one for each proposed driveway. The access gates would remain locked, except during operations and maintenance activities. A pedestrian gate would also be located adjacent to the southern side of the proposed data center building that would provide access to the sidewalk along Saturn Street. The Project would also include security measures such as security lighting, a surveillance camera system, and 24/7 security personnel.

2.4.5 Landscaping

The Project would include landscaping on the western and eastern ends of the Project Site, along the western side of the proposed data center building, along the western and eastern sides of the proposed equipment yard, along the eastern side of the proposed substation, and throughout the proposed parking lot. A landscape buffer with a minimum width of three feet would also be provided along the northwestern boundary of the Project Site that abuts adjacent residential uses. Proposed landscaping would include native trees, shrubs, grasses, and groundcover, all of which would have very low or low water needs. The Project would plant 77 new trees throughout the Project Site, 21 of which would be street trees along the proposed sidewalk. Project development would include the removal of approximately 186 existing trees on-site. The Project would be equipped with a low flow irrigation system consisting of a weather-based smart controller and low rotors, bubbler, or drip systems. Proposed landscaping would be consistent with the surrounding buildings to comply with the City's design requirements.

2.4.6 Utilities and Infrastructure

Water

Potable water for the Project Site is provided by the San Gabriel Valley Municipal Water District. The City's Public Works Department Engineering Division owns and maintains all water

infrastructure, including on-site and off-site facilities. The existing public water lines would be removed and rerouted, subject to approval from the City of Monterey Park Public Works Department.

Four existing fire hydrants are located in the vicinity of the Project Site: one on Orange Avenue and three on Saturn Street. Approximately four new fire hydrants would be installed on-site. All fire and water design improvements must comply with applicable law, including, without limitation, the California Fire Code as adopted by the MPMC. The Project would include new internal fire water, domestic water, and irrigation water utility lines that would connect to the water main line within Saturn Street.

Wastewater

The Project Site falls within the service area of the A.K. Warren Water Resource Facility, which is owned and operated by the Los Angeles County Sanitation Districts ("LACSD"). The Project would connect to the existing sanitary sewer main line within Saturn Street. The existing 10-foot-sewer easement located on-site would be quitclaimed.

Drainage

Stormwater from the Project Site is collected on-site via catch basins and is routed through pipes that ultimately connect to the existing public catch basins/storm drain main line within Saturn Street. There are City-owned public catch basins directly in front of the existing commercial building and public catch basins near the Project Site's existing southerly driveway.

The Project's anticipated stormwater treatment design is comprised of two stormwater catchment systems. Each one consisting of a proprietary biofiltration unit and detention system that would be located on the northwestern and southeastern portions of the Project Site. A stormwater lift station would also be installed on the southeastern portion of the Project Site. New catch basins would be installed throughout the Project Site. New internal storm drain lines would be constructed and would connect to the existing storm drain main line within Saturn Street.

Solid Waste

Solid waste generated by the Project would be collected and hauled away by the City's solid waste franchisee (Athens Services). The Project would include solid waste enclosures on the northeastern and northwestern portion of the Project Site, which would be shielded from view by retaining walls.

Electricity and Natural Gas

SCE is responsible for providing electrical services to the Project Site. As discussed above, a new substation owned and operated by the Applicant will be constructed as part of the Project.

The Project would not include any natural gas usage during Project operations.

2.4.7 Site Grading

The Project Site is bordered on the north by hillside that would remain undisturbed where the proposed design permits, as a general guideline using the existing parking lot limits and the limit of grading. There is currently only one area where there is cut into the hillside to accommodate the future substation. The proposed data center building takes up majority of the buildable land on the Project Site and spans nearly the entire frontage of Saturn Street. In order to capture the potential rainwater on-site, high and low points were created along the drive aisle and parking areas to route the water to the proposed catch basins.

2.5 Project Construction

Project construction is anticipated to occur over one phase, lasting approximately 24 months, beginning as early as September 2025 and ending as early as August 2027. Construction would occur consistent with the MPMC, including, without limitation, the City's noise policies. Specifically, construction would occur Monday through Friday from 7:00 A.M. to 7:00 P.M. or Saturday, Sunday, and holidays between 8:00 A.M. to 6:00 P.M. Project construction is anticipated to occur in the following sequence:

- Demolition,
- Site grading and construction preparation,
- Building construction,
- Utility Work,
- Paving,
- Interior construction and build-out,
- Installation of equipment and infrastructure, and
- Final inspections, testing, and commissioning.

Project Site preparation for the Project would require cutting and removal of approximately 500,000 square feet of concrete and approximately 65,000 cubic yards of soil export. Final grading plans would be approved by the City, as applicable.

2.6 Project Operations

2.6.1 Backup Energy Supply

A data center relies upon a constant supply of power to allow servers to operate continuously: 24 hours per day, seven days per week. To ensure continuous energy supply, the Project would utilize up to 12 4-MW backup generators upon loss of grid power. The backup generators are designed to start up quickly and run only as demand requires. All generators would be located outdoors in the equipment yard and would be surrounded by an acoustic screen wall. Generators would be placed in sound-attenuating enclosures. The generators would be laid out in one row

and reach a height of approximately 20 feet to top of generator enclosure, and up to 40 feet to top of exhaust stack.

The gen-sets would have maintenance testing performed throughout the year to ensure performance when needed during a power failure. All generators would be operated strictly in accordance with permitted hours as determined by the South Coast Air Quality Management District ("SCAQMD").

Each generator would be provided with a 7,000-gallon sub-base fuel storage tank, equating to 24 hours of runtime in emergency conditions. The sub-base fuel storage tanks will be provisioned with fuel ports to allow refilling from the internal access road and fire access road on-site. Additionally, the Project would include uninterruptable power supplies ("UPS") and direct current ("DC") plant energy equipment/batteries for backup power. Batteries would provide enough energy to cover the critical load of 36 MW in the event of a power failure. UPS and batteries would be located in the data center, adjacent to the computer room the system serves.

2.6.2 Cooling

Servers convert electrical energy as they operate and need to be kept cool. Therefore, cooling systems are a critical component of data center operation. Cooling systems would be installed to remove heat, ensuring servers operate safely and efficiently. The heating, ventilation, and air conditioning ("HVAC") equipment would include 23 air cooled chillers with free cooling modules, each rated at 460-tons of capacity, in an N+1 redundancy configuration to support data hall operations. Packaged HVAC rooftop units would provide cooling for the administrative and ancillary spaces. A Water Usage Effectiveness (WUE) of 0.0 would be anticipated given the design leverages a closed loop cooling system.

2.6.3 Employees

It is anticipated that up to 26 employees would typically work in the data center building throughout the day (daytime, evening, and overnight) every 24 hours.

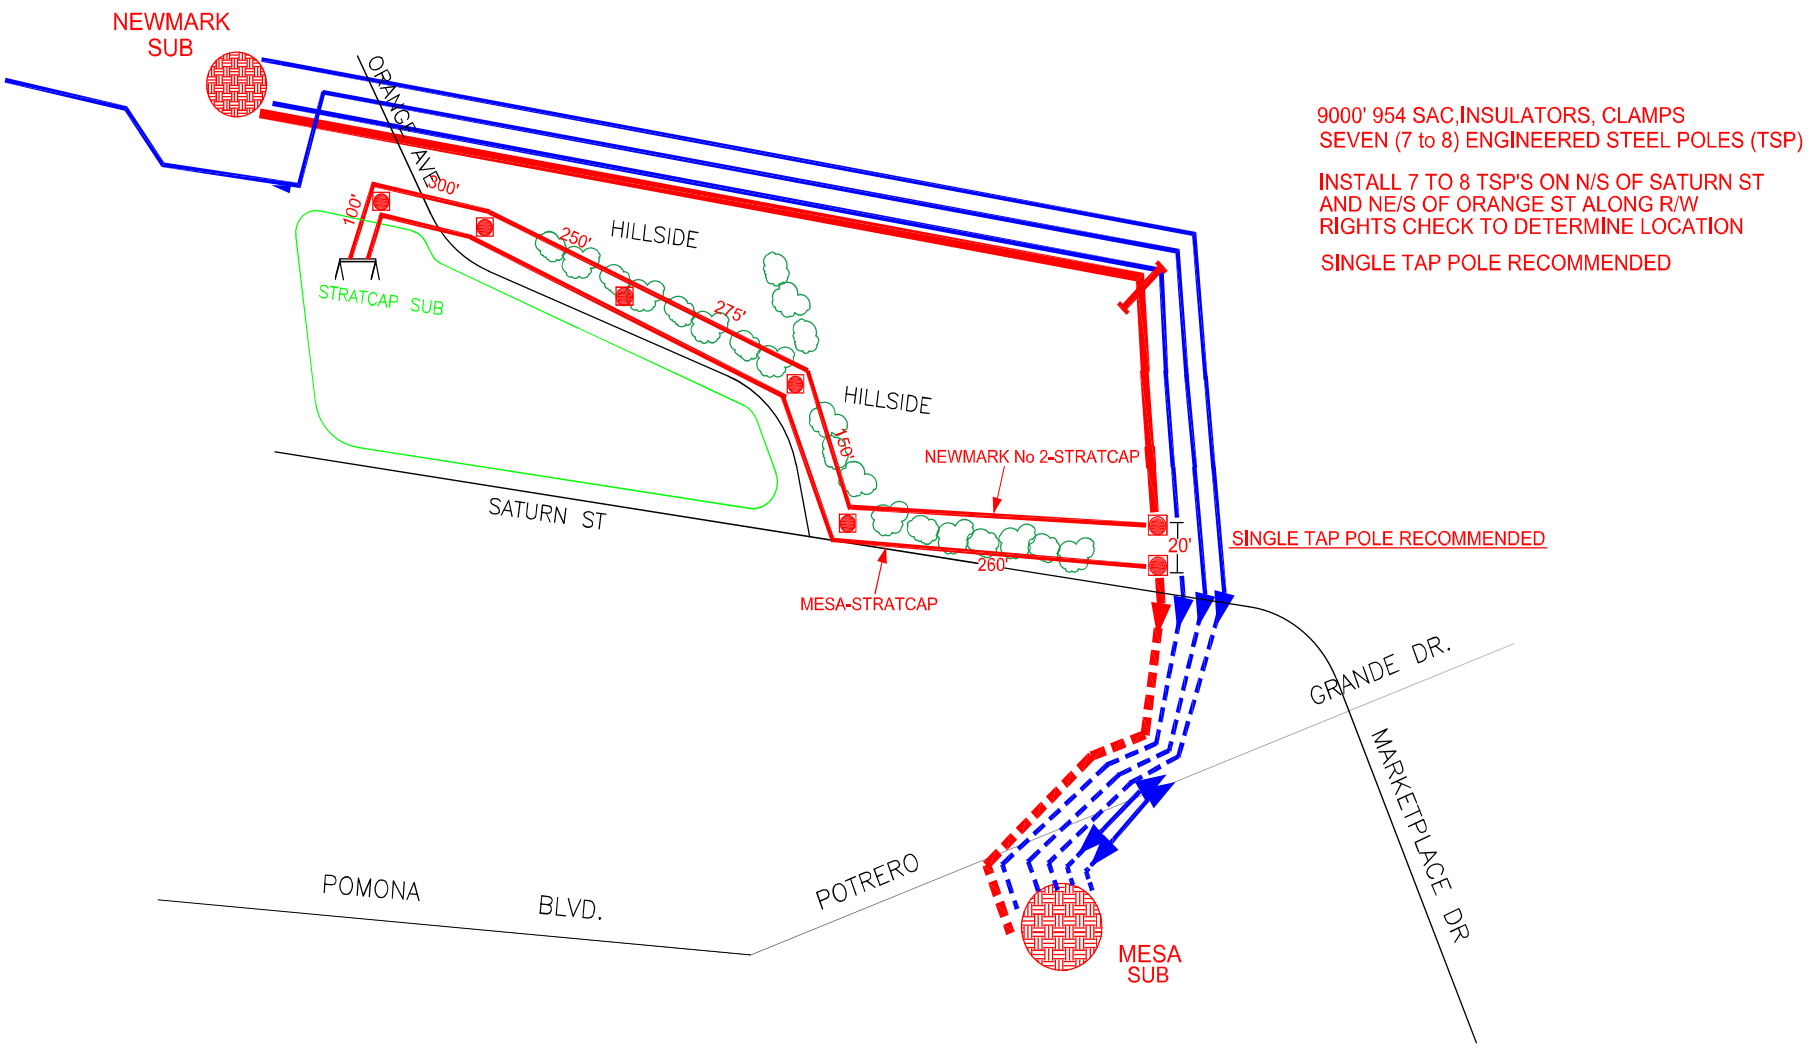
2.6.4 Vehicle Trips

Passenger vehicle trips to the Project Site would be minimal, consisting of employees traveling to the Project Site for work and occasional client visits. Truck trips would occur during Project operation to deliver and remove equipment as needed. Visitor and client trips to the Project Site are further analyzed in **Section 4.17**, **Transportation**, of this IS/MND.

2.6.5 Energy Usage

Major sources of energy demand for Project operations would be client servers and the cooling system. The facility would use a maximum of 49.9 MW for a maximum load of 1,197,160 kilowatt-hours ("kWh") daily. Overall, the daily power usage would vary depending on how many servers are running and how intensely the data center's clients are running their servers. The data center building would require minimal lighting, which would be used only to support the lobby, office space, corridors, storage space, and parking area.

2.7 Offsite Improvements for Southern California Edison ("SCE") Service



SCE prepared a Method of Service Study ("MOS") that verified SCE can provide power to the Project. The MOS identified the nearby Mesa Substation and the Newmark Substation as the sources of electricity for the Project. The electricity line routes from the Project to the substations, as well as the associated SCE infrastructure, are illustrated in **Figure 2-4: Offsite Improvements for Southern California Edison Service**. In addition, the MOS identified telecom transmission line routes from the Project to existing telecom infrastructure located at the Mesa Substation and along Potrero Grande Drive, as illustrated in **Figure 2-5: Transmission Telecom Improvements**. Per the MOS, preliminary review of the line routes assumes SCE will install its new facilities in franchise and/or within existing SCE right-of-way.

As noted in the MOS, the construction of the transmission lines would require a Permit To Construct ("PTC") from the California Public Utilities Commission ("CPUC"). The MOS concluded that construction of the transmission facilities would qualify for a PTC exemption when such construction activities are included in the environmental review of the Project for purposes of CEQA review. Accordingly, this IS/MND includes analysis of the SCE offsite improvements identified in the MOS for the Project.

The SCE improvements would include installation of new overheard and/or underground facilities that connect the SCE substations, and existing telecom infrastructure, to the Project. That construction would be minor and likely occur within public and SCE existing right-of-way, which will result in minimal disturbance of land and/or airspace. Per the MOS, the improvements would mostly occur on the Project Site (for a new substation) and be limited to new rack relays at the existing Mesa Substation and Newmark Substation. Those relay installations involve minor equipment upgrades at the existing SCE substations and would not require substantial construction that could significantly impact the environment.

In addition, per the MOS, the SCE improvements include the installation of seven to eight tubular steel poles and steel aluminum conductor for the 66 kilovolt ("kV") transmission line from the SCE substations, and existing powerline infrastructure, to the Project. Installation of that equipment would involve minor excavation to place the power poles, support footings, and installation of the related power transmission lines. For the telecom lines, the MOS indicates there will be primary and secondary telecom transmission lines running from the Mesa Substation to the Project. Construction of those underground lines would likely require excavation in the existing right-of-way along portions of Saturn Street, South Orange Avenue, and Potrero Grande Drive. The excavation would be limited to the area needed to install conduit for the telecom lines and a series of new manholes to access the telecom line.

2.8 Agreements, Permits, and Approvals

The City has discretionary authority over the proposed Project. Other agencies, in addition to the City, are expected to use this IS/MND in their decision-making process. To implement this Project, several discretionary permits are required from the City and other agencies including, without limitation, at a minimum, the following discretionary permits/approvals must be granted by the City and others:

- Adoption of the Initial Study/Mitigated Negative Declaration;
- Approval of CUPs for a project on a lot size over one acre, and mechanical equipment exceeding height, if needed;
- Design Review;
- Approval of a Development Agreement, due to the Project's large scale development, and activation of the BRDZ pursuant to the MPMC;
- Tree removal;
- SCAQMD Authority to Construct/Permit to Operate; and
- Permits to Construct SCE Facilities.

2.9 Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by the Project, involving at least one impact that is a "Potentially Significant Impact" or “Less Than Significant With Mitigation Incorporated,” as indicated by the checklist on the following pages.

	Aesthetics		Agricultural and Forestry Resources		Air Quality
	Biological Resources	X	Cultural Resources		Energy
X	Geology & Soils		Greenhouse Gas Emissions	X	Hazards & Hazardous Materials
	Hydrology & Water Quality		Land Use & Planning		Mineral Resources
	Noise		Population & Housing		Public Services
	Recreation		Transportation	X	Tribal Cultural Resources
	Utilities & Service Systems		Wildfire	X	Mandatory Findings of Significance

3.0 LEAD AGENCY DETERMINATION

On the basis of this initial evaluation:

I find that the proposed Project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.	
I find that although the proposed Project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the Project have been made by or agreed to by the Project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.	X
I find that the proposed Project MAY have a significant effect on the environment and an ENVIRONMENTAL IMPACT REPORT is required.	
I find that the proposed Project MAY have a potentially significant or a potentially significant unless mitigated impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.	
I find that although the proposed Project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed Project, nothing further is required.

4.0 EVALUATION OF ENVIRONMENTAL IMPACTS

The following environmental analysis is patterned after CEQA Guidelines Appendix G**.** An explanation is provided for all responses except "No Impact" responses, which are supported by the cited information sources. The responses consider the whole action involved with the proposed Project: on- and off-site, Project- and cumulative-level, direct and indirect, and short-term construction and long-term operational. The explanation of each issue also identifies the significance criteria or threshold, if any, used to evaluate each question, and the mitigation identified, if any, to avoid or reduce the impact to less than significant. To each question, there are four possible responses:

- **No Impact.** The Project would not have any measurable environmental impact.
- **Less Than Significant Impact.** The Project would have the potential to impact the environment, although this impact would be below-established thresholds that are considered to be significant.
- **Less Than Significant With Mitigation Incorporated.** The Project would have the potential to generate impacts, which may be considered as a significant effect on the environment, although mitigation measures or changes to the Project's physical or operational characteristics could reduce these impacts to a less than significant level.
- **Potentially Significant Impact.** The Project could have impacts, which may be considered significant, and therefore additional analysis is required to identify mitigation. A determination that there is a potential for significant effects indicates the need to more fully analyze the Project's impacts and identify mitigation.

4.1 Aesthetics

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Except as provided in Public Resources Code Section 21099, would the project:				
a) Have a substantial adverse effect on a scenic vista?				X
b) Substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a State Scenic Highway?				X
c) If in a non-urbanized area, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?			X	
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?			X	

Impact Analysis

4.1a Would the project have a substantial adverse effect on a scenic vista?

No Impact. Under CEQA, a scenic vista is defined as a viewpoint that provides expansive views of a highly-valued landscape for the public's benefit. The Project Site is currently developed with a two-story commercial office building, surface parking lot, and a grass lot. The Project Site is within a fully developed area of the City dominated by single-family residences and office uses. Overall Project Site topography is mostly flat, except for the northern boundary of the Project Site, which moderately slopes up to the hill bordering the northern Project Site boundary. The City's General Plan does not designate any scenic vistas within the City. The closest scenic resource to the Project Site is the San Gabriel Mountains approximately 10 miles to the north. However, existing views of these mountains are entirely obscured from street view along Saturn Street by surrounding urban development, trees, and the hill bordering the northern Project Site boundary. There are no prominent topographical features on the Project Site from which scenic vistas could be viewed, nor does the Project Site contain a scenic vista.

Upon Project development, views of the San Gabriel Mountains would continue to be blocked along Saturn Street. The Project would not directly obstruct an existing public view of a scenic vista as no scenic vistas are in the Project Site vicinity. Therefore, Project development would not result in a substantial adverse effect on a scenic vista. There would be no impacts to scenic vistas, and no mitigation measures would be required.

4.1b Would the project substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a State Scenic Highway?

No Impact. There are no State-designated scenic highways in the City.[3] The nearest eligible scenic highway is SR 39 located approximately 13 miles northeast of the Project Site, and the nearest officially designated scenic highway is the portion of SR 2 located within the Angeles National Forest, approximately 13 miles northwest of the Project Site. Therefore, the Project would not damage scenic resources within a State scenic highway. No impact would occur in this regard.

4.1c If in a non-urbanized area, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less Than Significant Impact. The Project Site is in an urbanized area of the City; therefore, the applicable threshold with respect to the Project is whether the Project is consistent with applicable zoning and other regulations governing scenic quality.

The Project Site is zoned Office Professional (Voter Enacted) (O-P). Pursuant to MPMC Chapter 21.14, O-P – Office Professional Zone (Voter Enacted), the O-P Zone is intended to provide for the development of integrated professional, office and limited retail areas that exhibit a diversity of business activity from both revenue and service quality standpoints, and which are compatible and responsive to abutting land uses, including residential developments. Data centers are a principally permitted use in the O-P Zone.

The Project Site has a General Plan land use designation of Innovation/Technology. The primary uses allowed within this land use designation include research and development, light manufacturing, service commercial, professional offices, entertainment, and breweries/wineries/distilleries. The Project proposes to develop a data center, which is a permitted use within the Innovation/Technology General Plan land use designation. Furthermore, the maximum FAR for the Innovation/Technology designation is 0.60 with a maximum height of 40 feet. The proposed FAR for the Project is 0.32, which is below the maximum permitted FAR. The Project would also have a maximum height of 36 feet (exclusive of the mechanical equipment platform screening), which is below the maximum permitted height. In addition, if needed, the MPMC permits the City to issue a CUP for height exceedances in the O-P Zone per MPMC Section 21.14.090.

The Project would be consistent with the zoning for the Project Site, including the land use, FAR, height, and setback requirements, standards, and limits established for the Project Site. With City approval of the requested actions to allow for a demand-based reduction in the number of parking spaces provided, the Project's provision of 68 parking spaces would be consistent with the MPMC. Therefore, impacts would be less than significant.

[3] California Department of Transportation, California State Scenic Highway System Map, 2019, https://caltrans.maps.arcgis.com/apps/webappviewer/index.html?id=465dfd3d807c46cc8e8057116f1aacaa. Accessed on February 6, 2024.

4.1d Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less Than Significant Impact. Existing outdoor lighting at and near the Project Site is associated with office and commercial parking, and street lighting along Saturn Street typical of urbanized areas. New light sources introduced by the Project may increase ambient nighttime illumination levels.

Construction

Pursuant to MPMC Section 4.50.100, Sound Level Limits—Exceptions, construction activities would occur Monday through Friday from 7:00 A.M. to 7:00 P.M. and/or Saturday, Sunday, and holidays from 8:00 A.M. to 6:00 P.M. While the majority of Project construction would occur during daylight hours, there is a potential that construction could require the use of artificial lighting, particularly during the winter season when daylight is no longer sufficient earlier in the day. To the extent artificial light sources are required, such use would be temporary and would cease upon completion of Project construction. Furthermore, construction-related illumination would be used for safety and security purposes only, in compliance with MPMC light intensity requirements. Additionally, as part of the Project, construction lighting would be shielded to minimize light spillover. Construction lighting, while potentially bright, would be focused on the particular area undergoing work.

Daytime glare could potentially occur during construction activities if reflective construction materials were positioned in highly visible locations where the reflection of sunlight could occur. However, any glare would be highly transitory and short-term, given the movement of construction equipment and materials within the construction area, and the temporary nature of construction activities. In addition, large, flat surfaces that generate substantial glare are typically not an element of construction activities. Furthermore, temporary construction fencing comprised of a solid material or including screening would be placed along the periphery of the Project Site to screen construction activity from view at the street view at off-site locations. Therefore, there would be a negligible potential for daytime or nighttime glare associated with construction activities to occur.

Based on the above, light and glare associated with Project construction activities would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Therefore, impacts related to light and glare during construction would be less than significant.

Operation

The Project would introduce new sources of light and glare that are typically associated with data center buildings, including architecture, interior, security, and wayfinding lighting sources. In addition, the Project is replacing an existing commercial building on the Project Site, which has existing and similar sources of site lighting. Also, all Project lighting would comply with current energy standards and codes, while providing efficient and effective on-site lighting. Nighttime security lighting for the Project would be provided to illuminate building entrances, parking areas, and internal roadways and walkways. The nearest sensitive receptors in the vicinity of the Project

Site are the single-family residences along Clover Drive to the west. However, all exterior lights would be wall- or ground-mounted and shielded away from adjacent land uses and security lighting would be designed to prevent light trespass onto adjacent properties. It is not anticipated that the amount of light emanating from the Project would represent a noticeable increase over current light levels.

The Project would include appropriate levels of interior and exterior lighting for security, parking, and architectural highlighting. Outdoor lighting would be designed and installed with shielding, such that lighting would be directed and focused on the Project in accordance with MPMC lighting regulations that require that operational lighting would be directed downward or on the specific on-site feature to be lit and avoid direct glare onto exterior glazed windows or glass doors of existing and adjacent uses.

Regarding glare, daytime glare can result from sunlight reflecting from a shiny surface that would interfere with the performance of an off-site activity, such as the operation of a motor vehicle. Reflective surfaces can be associated with window glass and polished surfaces, such as metallic trim. In general, sun reflection that has the greatest potential to interfere with driving occurs from the lower stories of a structure. Similar to the existing development at the Project Site, sun reflection from the Project would occur during periods in which the sun is low on the horizon and when the point of reflection within the Project Site is in front of the driver, in the direction of travel. The Project Site currently contains a surface parking lot and an existing office building constructed of various non-reflective materials. No sources of substantial glare are anticipated with implementation of the Project. Exterior building materials of the proposed data center would use various non-reflective material designed to minimize the transmission of glare from the Project's buildings and would not include polished metals. The Project building would be prohibited from using highly reflective building materials such as mirrored glass on exterior facades. Parking would be screened from street-level public view by proposed landscaping and trees along Saturn Street, thereby reducing potential nighttime glare from vehicles.

Based on the above, the Project would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the area. Therefore, impacts would be less than significant.

4.2 Agricultural and Forestry Resources

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?				X
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?				X
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?				X
d) Result in the loss of forest land or conversion of forest land to non-forest use?				X
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?				X

Impact Analysis

4.2a Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

4.2b Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

4.2c Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?

4.2d Would the project result in the loss of forest land or conversion of forest land to non-forest use?

4.2e Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

No Impact. According to the California Department of Conservation's California Important Farmland Finder, no Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance is mapped within or in the immediate vicinity of the Project Site.[4] Further, there is no land under a Williamson Act Contract in the City.[5] Therefore, the Project would not conflict with any existing Williamson Act Contract. Additionally, the Project Site is zoned Office Professional (Voter Enacted) (O-P). No agricultural, forest land, or timberland zoning exists in the City.[6] Therefore, no impact concerning mapped farmlands, Williamson Act contracts, or agricultural, forest, or timber land zoning would occur.

4.3 Air Quality

This Section is based on the *Air Quality Analysis Memorandum* (Kimley-Horn, August 2024), *Office Improvements for Southern California Edison Service* (Kimley-Horn, September 2024), and *Health Risk Assessment Memorandum* (Kimley-Horn, October 2024), which are included as **Appendix A-1: Air Quality Analysis Memorandum, Appendix A-2: Offsite Improvements for Southern California Edison Service,** and **Appendix B: Health Risk Assessment Memorandum,** respectively.

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?			X	
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard?			X	
c) Expose sensitive receptors to substantial pollutant concentrations?			X	
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?			X	

Regulatory Setting

Federal

Federal Clean Air Act

Air quality is federally protected by the Federal Clean Air Act ("FCAA") and its amendments. Under the FCAA, the United States Environmental Protection Agency ("U.S. EPA") developed the primary and secondary National Ambient Air Quality Standards ("NAAQS") for the criteria air pollutants including ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide ("CO"), sulfur dioxide (SO_2), particulate matter up to 10 microns (PM10), particulate matter up to 2.5 microns ("PM2.5"), and lead. Proposed projects in or near nonattainment areas could be subject to more stringent air-permitting requirements. The FCAA requires each State to prepare a State Implementation Plan ("SIP") to demonstrate how it will attain the NAAQS within the federally imposed deadlines.

The U.S. EPA can withhold certain transportation funds from states that fail to comply with the planning requirements of the FCAA. If a State fails to correct these planning deficiencies within two years of Federal notification, the U.S. EPA is required to develop a Federal implementation plan for the identified nonattainment area or areas. The provisions of 40 Code of Federal Regulations Parts 51 and 93 apply in all nonattainment and maintenance areas for

transportation-related criteria pollutants for which the area is designated nonattainment or has a maintenance plan. The U.S. EPA has designated enforcement of air pollution control regulations to the individual states. Applicable NAAQSs are summarized in **Table 4.3-1: State and National Ambient Air Quality Standards.**

Table 4.3-1: State and National Ambient Air Quality Standards

Pollutant	Averaging Time	State Standards[1]	National Standards[2]
Ozone (O_3) [2, 5, 7]	8 Hour	0.070 ppm (137 µg/m^3)	0.070 ppm
	1 Hour	0.09 ppm (180 µg/m^3)	NA
Carbon Monoxide (CO)	8 Hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)
	1 Hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)
Nitrogen Dioxide (NO_2)	1 Hour	0.18 ppm (339 µg/m^3)	0.10 ppm[11]
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)
Sulfur Dioxide (SO_2) [8]	24 Hour	0.04 ppm (105 µg/m^3)	0.14 ppm (365 µg/m^3)
	1 Hour	0.25 ppm (655 µg/m^3)	0.075 ppm (196 µg/m^3)
	Annual Arithmetic Mean	NA	0.03 ppm (80 µg/m^3)
Particulate Matter (PM10) [1, 3, 6]	24-Hour	50 µg/m^3	150 µg/m^3
	Annual Arithmetic Mean	20 µg/m^3	NA
Fine Particulate Matter (PM2.5) [3, 4, 6, 9]	24-Hour	NA	35 µg/m^3
	Annual Arithmetic Mean	12 µg/m^3	9.0 µg/m^3
Sulfates (SO_{4-2})	24 Hour	25 µg/m^3	NA
Lead (Pb) [10, 11]	30-Day Average	1.5 µg/m^3	NA
	Calendar Quarter	NA	1.5 µg/m^3
	Rolling 3-Month Average	NA	0.15 µg/m^3
Hydrogen Sulfide (H_2S)	1 Hour	0.03 ppm (0.15 µg/m^3)	NA
Vinyl Chloride (C_2H_3Cl) [10]	24 Hour	0.01 ppm (26 µg/m^3)	NA

ppm = parts per million; µg/m^3 = micrograms per cubic meter; mg/m^3 = milligrams per cubic meter; NA = no information available.

1. California standards for O_3, CO (except Lake Tahoe), SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter - PM10, and visibility reducing particles are values that are not to be exceeded. The standards for sulfates, Lake Tahoe CO, lead, H_2S, and vinyl chloride are not to be equaled or exceeded. If the standard is for a 1-hour, 8-hour or 24-hour average (i.e., all standards except for lead and the PM10 annual standard), then some measurements may be excluded. Measurements are excluded that CARB determines would occur less than once per year on the average. The Lake Tahoe carbon monoxide standard is 6.0 ppm, a level one-half the national standard and two-thirds the State standard.
2. National standards shown are the "primary standards" designed to protect public health. National standards other than for O_3, particulates and those based on annual averages are not to be exceeded more than once a year. The 1-hour O_3 standard is attained if, during the most recent three-year period, the average number of days per year with maximum hourly concentrations above the standard is equal to or less than one. The 8-hour O_3 standard is attained when the 3-year average of the 4th highest daily concentrations is 0.070 ppm or less. The 24-hour PM10 standard is attained when the 3-

Table 4.3-1: State and National Ambient Air Quality Standards

year average of the 99th percentile of monitored concentrations is less than 150 µg/m_3. The 24-hour PM2.5 standard is attained when the 3-year average of 98th percentiles is less than 35 µg/m^3.

3. Except for the national particulate standards, annual standards are met if the annual average falls below the standard at every site. The national annual particulate standard for PM10 is met if the 3-year average falls below the standard at every site. The annual PM2.5 standard is met if the 3-year average of annual averages spatially-averaged across officially designed clusters of sites falls below the standard.
4. NAAQS are set by the U.S. EPA at levels determined to be protective of public health with an adequate margin of safety.
5. On October 1, 2015, the national 8-hour O_3 primary and secondary standards were lowered from 0.075 to 0.070 ppm. An area will meet the standard if the fourth-highest maximum daily 8-hour O_3 concentration per year, averaged over three years, is equal to or less than 0.070 ppm. U.S. EPA will make recommendations on attainment designations by October 1, 2016, and issue final designations October 1, 2017. Nonattainment areas will have until 2020 to late 2037 to meet the health standard, with attainment dates varying based on the O_3 level in the area.
6. The national 1-hour O_3 standard was revoked by the U.S. EPA on June 15, 2005.
7. In June 2002, CARB established new annual standards for PM2.5 and PM10.
8. The 8-hour California O_3 standard was approved by the CARB on April 28, 2005 and became effective on May 17, 2006.
9. On June 2, 2010, the U.S. EPA established a new 1-hour SO_2 standard, effective August 23, 2010, which is based on the 3-year average of the annual 99th percentile of 1-hour daily maximum concentrations. The existing 0.030 ppm annual and 0.14 ppm 24-hour SO_2 NAAQS however must continue to be used until one year following U.S. EPA initial designations of the new 1-hour SO_2 NAAQS.
10. In December 2012, U.S. EPA strengthened the annual PM2.5 NAAQS from 15.0 to 12.0 µg/m^3. In December 2014, the U.S. EPA issued final area designations for the 2012 primary annual PM2.5 NAAQS. Areas designated "unclassifiable/attainment" must continue to take steps to prevent their air quality from deteriorating to unhealthy levels. The effective date of this standard is April 15, 2015.
11. CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure below which there are no adverse health effects determined.
12. National lead standard, rolling 3-month average: final rule signed October 15, 2008. Final designations effective December 31, 2011.

Source: South Coast Air Quality Management District, Air Quality Management Plan, 2022; California Air Resources Board, Ambient Air Quality Standards, May 6, 2016, and U.S. EPA, NAAQS Table, February 7, 2024.

State

California Air Resources Board

CARB administers the air quality policy in California. The California Ambient Air Quality Standards ("CAAQS") were established in 1969 pursuant to the Mulford-Carrell Act. The CAAQS, included with the NAAQS in **Table 4.3-1**, are generally more stringent and apply to more pollutants than the NAAQS. In addition to the criteria pollutants, CAAQS have been established for visibility reducing particulates, hydrogen sulfide, and sulfates.

The California Clean Air Act ("CCAA"), which was approved in 1988, requires that each local air district prepare and maintain an Air Quality Management Plan ("AQMP") to achieve compliance with CAAQS. These AQMPs also serve as the basis for the preparation of the SIP for meeting NAAQS for the State of California. Like the U.S. EPA, CARB also designates areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a CAAQS for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events such as wildfires, volcanoes, etc. are not considered violations of a CAAQS, and are not used as a basis for designating areas as nonattainment. The applicable CAAQS are summarized in **Table 4.3-1**.

Regional

South Coast Air Quality Management District ("SCAQMD")

Regionally, air quality is governed by the SCAQMD, the air pollution control agency for Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino Counties. The SCAQMD's primary responsibility is ensuring that California Ambient Air Quality Standards ("CAAQS") and NAAQS are attained and maintained in the South Coast Air Basin ("SoCAB"). The SCAQMD is also responsible for adopting and enforcing rules and regulations concerning air pollutant sources, issuing permits for stationary sources of air pollutants, inspecting stationary sources of air pollutants, responding to citizen complaints, monitoring ambient air quality and meteorological conditions, awarding grants to reduce motor vehicle emissions, conducting public education campaigns, and many other activities.

The SCAQMD is also the lead agency in charge of developing the Air Quality Management Plan ("AQMP"), with input from the Southern California Association of Governments ("SCAG") and the CARB. The AQMP is a comprehensive plan that includes control strategies for stationary and area sources, as well as for some on-road and off-road mobile sources. SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. Under federal law, SCAG is designated as a Metropolitan Planning Organization and under State law as a Regional Transportation Planning Agency and a Council of Governments. SCAG has the primary responsibility for providing future growth projections and the development and implementation of transportation control measures. CARB, in coordination with federal agencies, provides the control element for mobile sources.

The 2016 AQMP was adopted by the SCAQMD Governing Board on March 3, 2017. The purpose of the AQMP is to set forth a comprehensive and integrated program that would lead the SoCAB into compliance with the federal 24-hour PM2.5 air quality standard, and to provide an update to the SCAQMD's commitments towards meeting the 8-hour O_3 NAAQS. Specifically, the 2016 AQMP covers the following NAAQS: 1979 1-hour O_3 NAAQS, 1997 8-hour O_3 NAAQS, 2006 24-hour PM2.5 NAAQS, 2008 8-hour O_3 NAAQS, and the 2012 annual PM2.5 NAAQS.

The 2022 AQMP, adopted by the SCAQMD Governing Board on December 2, 2022, was developed to address the requirements for meeting the 2015 8-hour O_3 standard. The 2022 AQMP builds upon measures already in place from previous AQMPs. It also includes a variety of additional strategies such as regulations, accelerated deployment of available cleaner technologies (e.g., zero emissions technologies, when cost-effective and feasible, and low NO_X technologies in other applications), best management practices, co-benefits from existing programs (e.g., climate and energy efficiency), incentives, and other FCAA measures to achieve the 2015 8-hour O_3 standard. An AQMP is a regional and multi-agency effort including the SCAQMD, the CARB, the SCAG, and the U.S. EPA. The 2022 AQMP incorporates the latest scientific and technological information and planning assumptions, including the *2020-2045 Regional Transportation Plan/Sustainable Communities Strategy* ("RTP/SCS"), entitled Connect SoCal 2024 RTP/SCS (referred to as "Connect SoCal") and updated emission inventory methodologies for

various source categories. Connect SoCal was approved by SCAG regional council on April 4, 2024, however CARB must formally approve the plan.

The SCAQMD has published the CEQA Air Quality Handbook (approved by the SCAQMD Governing Board in 1993 and augmented with guidance for Localized Significance Thresholds [LSTs] in 2008). The SCAQMD guidance helps local government agencies and consultants to develop environmental documents required by CEQA and provides identification of suggested thresholds of significance for criteria pollutants for both construction and operation (see discussion of thresholds below). With the help of the CEQA Air Quality Handbook and associated guidance, local land use planners and consultants are able to analyze and document how proposed and existing projects affect air quality in order to meet the requirements of the CEQA review process. The SCAQMD periodically provides supplemental guidance and updates to the handbook on their website.

The SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. Under federal law, SCAG is designated as a Metropolitan Planning Organization and under State law as a Regional Transportation Planning Agency and a Council of Governments.

The State and federal attainment status designations for the SoCAB are summarized in **Table 4.3-2: South Coast Air Basin Attainment Status**. The SoCAB is currently designated as a nonattainment area for the O_3, PM10, and PM2.5 CAAQS, as well as the 8-hour O_3 and PM2.5 NAAQS. The SoCAB is designated as attainment or unclassified for the remaining CAAQS and NAAQS.

Table 4.3-2: South Coast Air Basin Attainment Status

Pollutant	State	Federal
Ozone (O_3) (1 Hour Standard)	Non-Attainment	Non-Attainment (Extreme)
Ozone (O_3) (8 Hour Standard)	Non-Attainment	Non-Attainment (Extreme)
Particulate Matter (PM2.5) (24 Hour Standard)	–	Non-Attainment (Serious)
Particulate Matter (PM2.5) (Annual Standard)	Non-Attainment	Non-Attainment (Serious)
Particulate Matter (PM10) (24 Hour Standard)	Non-Attainment	Attainment (Maintenance)
Particulate Matter (PM10) (Annual Standard)	Non-Attainment	–
Carbon Monoxide (CO) (1 Hour Standard)	Attainment	Attainment (Maintenance)
Carbon Monoxide (CO) (8 Hour Standard)	Attainment	Attainment (Maintenance)
Nitrogen Dioxide (NO_2) (1 Hour Standard)	Attainment	Unclassifiable/Attainment
Nitrogen Dioxide (NO_2)	Attainment	Attainment (Maintenance)

Table 4.3-2: South Coast Air Basin Attainment Status		
Pollutant	**State**	**Federal**
(Annual Standard)		
Sulfur Dioxide (SO_2) (1 Hour Standard)	Attainment	Unclassifiable/Attainment

The following is a list of SCAQMD rules that are required of construction activities associated with the Project:

- **Rule 402 (Nuisance)** – This rule prohibits the discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. This rule does not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.
- **Rule 403 (Fugitive Dust)** – This rule requires fugitive dust sources to implement best available control measures for all sources, and all forms of visible particulate matter are prohibited from crossing any property line. This rule is intended to reduce PM10 emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust. PM10 suppression techniques are summarized below.

  a) Portions of a construction site to remain inactive longer than a period of three months will be seeded and watered until grass cover is grown or otherwise stabilized.

  b) All on-site roads will be paved as soon as feasible or watered periodically or chemically stabilized.

  c) All material transported off-site will be either sufficiently watered or securely covered to prevent excessive amounts of dust.

  d) The area disturbed by clearing, grading, earthmoving, or excavation operations will be minimized at all times.

  e) Where vehicles leave a construction site and enter adjacent public streets, the streets will be swept daily or washed down at the end of the work day to remove soil tracked onto the paved surface.

- **Rule 1113 (Architectural Coatings)** – This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce ROG emissions from the use of these coatings, primarily by placing limits on the ROG content of various coating categories.

- **Rule 1401 (New Source Review of Toxic Air Contaminants)** – This rule establishes limits for maximum individual cancer risk (MICR), cancer burden, and noncancer acute and chronic hazard index ("HI") from new permit units, relocations, or modifications to existing permit units which emit applicable toxic air contaminants. DPM is a substance listed in Table 1 of the Rule.[7] Therefore, the requirements to allow the construction and use of the new generators are as follows:

    - **MICR and Cancer Burden:** The cumulative increase in MICR which is the sum of the calculated MICR values for all toxic air contaminants emitted from the new, relocated or modified permit unit will not result in any of the following:

        - an increased MICR greater than one in one million (1.0×10^{-6}) at any receptor location, if the permit unit is constructed without TBACT;

        - an increased MICR greater than ten in one million (10×10^{-6}) at any receptor location, if the permit unit is constructed with T-BACT;

        - a cancer burden greater than 0.5.

    - **Chronic Hazard Index:** The cumulative increase in total chronic HI for any target organ system due to total emissions from the new, relocated or modified permit unit owned or operated by the applicant for which applications were deemed complete on or after the date when the risk value for the compound is finalized by the state Office of Environmental Health Hazard Assessment ("OEHHA") will not exceed 1.0 at any receptor location.

    - **Acute Hazard Index:** The cumulative increase in total acute HI for any target organ system due to total emissions from the new, relocated or modified permit unit owned or operated by the applicant for which applications were deemed complete on or after the date when the risk value for the compound is finalized by OEHHA will not exceed 1.0 at any receptor location.

- **Rule 1402 (Control of Toxic Air Contaminants From Existing Sources)** – This rule reduces the health risk associated with emissions of TACs from existing sources by specifying notification risk levels, action risk levels, and significant risk levels for MICR, cancer burden, and non-cancer acute and chronic HI applicable to total facility emissions. The rule establishes requirements to implement Risk Reduction Plans to achieve specified risk limits, as required by the Hot Spots Act and this rule.

[7] SCAQMD, Rule 1401, page 1401-17, http://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1401.pdf?sfvrsn=4. Accessed April 22, 2024.

- **Rule 1403 (Asbestos Emissions From Demolition/Renovation Activities)** – This rule applies to owners and operators of any demolition or renovation activity, and the associated disturbance of asbestos-containing material (ACM), any asbestos storage facility, or any active waste disposal site. This rule includes requirements for activities, handling and clean-up procedures, storage, disposal and landfill requirements.
- **Rule 1415 (Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems)** – The purpose of this rule is to reduce emissions of high-global warming potential refrigerants from stationary air conditioning systems by requiring project's to reclaim, recover, or recycle refrigerant and minimize leakage.
- **Rule 1466 (Control Of Particulate Emissions from Soils With Toxic Air Contaminants)** – This rule applies to projects with earth-moving activities of soil with applicable toxic air contaminants ("TACs") that have been identified as contaminants of concern at a site.
- **Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines)** – This rule applies to stationary compression ignition ("CI") engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

Local

City of Monterey Park General Plan

The City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City's General Plan has multiple elements that contain the following policies specific to air quality regarding the Project:

Land Use and Urban Design Element

Goal 4: A built environment that is resilient and promotes health and wellness.

Policy 4.5 New Development: Ensure new development is planned in areas that can sustain it long-term considering air quality, health indicators of residents, infrastructure networks and services, and socio-economic factors.

Resources Element

Goal 5: Improve air quality for future generations of Monterey Park residents.

Policy 5.8 Integrate air quality planning with land use and transportation planning.

Environmental Justice Element

Goal 2: Community health and the reduction of exposure to environmental pollutants is

a priority and part of all planning and policy practices.

Policy 2.1 Limit exposure to environmental pollution through good planning and the public process.

Background

SCAQMD Thresholds

Mass Emissions Thresholds

The significance criteria established by SCAQMD may be relied upon to make the above determinations. According to the SCAQMD, an air quality impact is considered significant if a Project would violate an ambient air quality standard, contribute substantially to an existing or projected air quality violation, or expose sensitive receptors to substantial pollutant concentrations. The SCAQMD has established numeric thresholds of significance for air pollutants resulting from construction and operational activities of land use development projects, as shown in **Table 4.3-3: South Coast Air Quality Management District Emissions Thresholds**.

Table 4.3-3: South Coast Air Quality Management District Emissions Thresholds

Criteria Air Pollutants and Precursors (Regional)	Mass Daily Thresholds (pounds per day)	
	Construction	Operations
Reactive Organic Gases (ROG)[1]	75	55
Carbon Monoxide (CO)	550	550
Nitrogen Oxides (NO_X)	100	55
Sulfur Oxides (SO_X)	150	150
Coarse Particulates (PM10)	150	150
Fine Particulates (PM2.5)	55	55

1. VOCs and ROGs are subsets of organic gases that are emitted from the incomplete combustion of hydrocarbons or other carbon-based fuels. Although they represent slightly different subsets of organic gases, they are used interchangeably for the purposes of this analysis.

Source: SCAQMD, SCAQMD Air Quality Significance Thresholds, April 2019.

Localized Carbon Monoxide

In addition to the daily thresholds listed above, development associated with the Project would also be subject to the CAAQS and NAAQS. These are addressed though an analysis of localized CO impacts. The significance of localized impacts depends on whether ambient CO levels near the Project are above CO CAAQS and NAAQS (the more stringent CAAQS are 20 ppm for 1-hour and 9 ppm for 8-hour). The SoCAB has been designated as attainment of the 1-hour and 8-hour CAAQS.

Localized Significance Thresholds

The SCAQMD developed Localized Significance Thresholds ("LST") for emissions of NO_2, CO, PM10, and PM2.5 generated at new development sites (off-site mobile source emissions are not included in the LST analysis). LSTs represent the maximum emissions that can be generated at a project without expecting to cause or substantially contribute to an exceedance of the most stringent state or federal ambient air quality standards. LSTs are based on the ambient

concentrations of that pollutant within the Project source receptor area ("SRA"), as demarcated by the SCAQMD, and the distance to the nearest sensitive receptor. LST analysis for construction is applicable for projects that disturb 5 acres or less on a single day. The City of Monterey Park is located within SCAQMD SRA 11 (South Coastal Los Angeles County). The nearest sensitive receptors are located approximately 65 feet from the Project Site (approximately 20 meters). LST thresholds are provided for source-receptor distances of 25, 50, 100, 200, and 500 meters. According to SCAQMD's *Localized Significance Threshold Methodology*, the closest receptor distance on the mass rate LST look-up tables is 25 meters. It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.[8] Therefore, LSTs for 25 meters were utilized in this analysis. LSTs associated with the 25-meter threshold are provided in **Table 4.3-4: Localized Significance Thresholds for Construction/Operations** to demonstrate that the emissions thresholds increase as acreages increase.

Table 4.3-4: Local Significance Thresholds (Construction/Operations)

Project Size	Maximum Pounds per Day							
	Construction				Operations			
	NO_x	CO	PM10	PM2.5	NO_x	CO	PM10	PM2.5
1 Acre	83	673	5	4	83	673	1	1
2 Acres	121	1,031	7	5	121	1,031	2	2
5 Acres	183	1,814	14	9	183	1,814	4	2

Note: Based on a receptor distance of 25 meters in SRA 11.
Source: SCAQMD, Localized Significance Threshold Methodology, July 2008.

Health Risk Analysis Thresholds

Project health risks are determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. While the final determination of significance thresholds is within the purview of the lead agency pursuant to the CEQA Guidelines, the SCAQMD recommends that the following air pollution thresholds be used by lead agencies in determining whether the impacts from the Project are significant. If the lead agency finds that the Project has the potential to exceed the applicable thresholds, the Project should be considered significant. The thresholds for air toxic emissions are as follows.

- **Cancer Risk (Individual):** Emit contaminants result in a maximum individual incremental cancer risk equal or greater than of 10 in one million.
- **Cancer Burden:** Emit contaminants that exceeds the cancer burden of 0.5 excess cancer cases (in areas that equal or exceed one in one million).
- **Non-Cancer Risk:** Emit contaminants that result in a chronic or acute hazard index (HI) equal to or greater than 1.0.

Cancer risk is expressed in terms of expected incremental incidence per million population. The SCAQMD has established an incidence rate of 10 persons per million as the maximum acceptable incremental increase in cancer risk due to TAC exposure. This threshold is an upper-bound

[8] SCAQMD, Localized Significance Threshold Methodology, July 2008, https://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf. Accessed April 22, 2024.

incremental probability to determine whether or not a given project has a potentially significant development-specific and cumulative impact and to ensure an individual new source does not contribute a cumulatively significant impact. The 10 in one million standard is a health-protective significance threshold. A risk level of 10 in one million implies a likelihood that up to 10 persons, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time. This risk would be an excess cancer that is in addition to any cancer risk borne by a person not exposed to these air toxics.

Sensitive Receptors

SCAQMD defines sensitive receptors as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and the chronically ill are likely to be located. These facilities may include residences, school playgrounds, child-care centers, retirement homes, convalescent homes, and people with illnesses.

Construction TAC and PM Health Risks

TACs are airborne substances that can cause short-term (acute) or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs includes more than 200 compounds, including particulate emissions from diesel-fueled engines.

Construction equipment and associated heavy-duty truck traffic generate diesel exhaust, which is a known TAC. Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors.

Under the SCAQMD Air Quality Guidelines, an incremental cancer risk of greater than 10 cases per million for a 70-year exposure duration at the Maximally Exposed Individual (MEI) will result in a significant impact. The 10 in 1 million threshold is based on the latest scientific data, and is designed to protect the most sensitive individuals in the population as each chemical's exposure level includes large margins of safety. In addition to this carcinogen threshold, the California Office of Environmental Health Hazard Assessment (OEHHA) recommends that the non-carcinogenic hazards for TACs at ground level should not exceed a chronic HI of greater than one.

Methodology

The Project's construction and operational emissions were calculated using the California Emissions Estimator Model version 2022.1.1.21 ("CalEEMod"). Details of the modeling assumptions and emission factors are provided in **Appendix A-1**. For construction, CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. Per the Transportation Analysis prepared for the Project, the Project is anticipated to generate approximately 52 daily vehicle trips. The modeling assumed "general office building" as the land use subtype because it was the most applicable as

data center is not an available subtype in the model. The "general office building" was chosen as a data center has similar building structure to an office building with primarily large open rooms with high ceilings and many individual smaller spaces for tenants. However, the electricity, natural gas, indoor and outdoor water, and daily trips were changed from default to information provided by the Applicant to more accurately represent the Project characteristics and associated air quality emissions. Pursuant to information provided in **Appendix E**, the Peak Power Demand Estimate Memorandum, the Project would require approximately 438 gigawatt hours ("GwH") per year of electricity and approximately 12 million gallons of water for indoor and outdoor water usage. No natural gas is proposed for the building.

Impact Analysis

4.3a Would the project conflict with or obstruct implementation of the applicable air quality plan?

Less Than Significant Impact. As part of its enforcement responsibilities, the U.S. EPA requires that each state with nonattainment areas prepare and submit a SIP that demonstrates the means to attain the federal standards. The SIP must integrate federal, state, and local plan components and regulations to identify specific measures to reduce pollution in nonattainment areas, using a combination of performance standards and market-based programs. Similarly, under State law, the CCAA requires an air quality attainment plan to be prepared for areas designated as nonattainment regarding the NAAQS and CAAQS. Air quality attainment plans outline emissions limits and control measures to achieve and maintain these standards by the earliest practical date.

The Project is located within the SoCAB, which is under the jurisdiction of the SCAQMD. The SCAQMD is required, pursuant to the FCAA, to reduce emissions of criteria pollutants for which the SoCAB is in nonattainment. To reduce such emissions, the SCAQMD adopted the 2016 AQMP and recently approved the 2022 AQMP (collectively, the "AQMPs"). The AQMPs establish a program of rules and regulations directed at reducing air pollutant emissions and achieving California's and national air quality standards. Because CARB approval of the 2022 AQMP may be reached during the expected Project entitlement period, this analysis compares the Project to both of the SCAQMD's AQMPs.

Criteria for determining project consistency with the AQMP are defined by the following indicators:

- **Consistency Criterion No. 1**: The Project will not result in an increase in the frequency or severity of existing air quality violations, or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.
- **Consistency Criterion No. 2**: The Project will not exceed the assumptions in the AQMP or increments based on the years of the Project build-out phase.

According to the SCAQMD's *CEQA Air Quality Handbook*, the purpose of the consistency finding is to determine if a project is inconsistent with the assumptions and objectives of the regional air

quality plans, and thus if it would interfere with the region's ability to comply with CAAQS and NAAQS.

The violations to which Consistency Criterion No. 1 refers are CAAQS and NAAQS. As discussed in Response 4.3b below, the Project would not exceed construction or operational emissions standards. Therefore, the Project would not contribute to an existing air quality violation, or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP. Thus, the Project is consistent with the first criterion.

Concerning Consistency Criterion No. 2, the AQMPs contains air pollutant reduction strategies based on SCAG's latest growth forecasts, and SCAG's growth forecasts were defined in consultation with local governments and with reference to local general plans. As discussed in the City's General Plan, the Project Site is within the Innovation/Technology land use designation. According to the Land Use and Urban Design Element of the General Plan, the primary uses allowed within this land use designation include research and development, light manufacturing, service commercial, professional offices, entertainment, and breweries/wineries. The Project proposes to develop a data center, which is a permitted use within the Innovation/Technology land use designation. The Project Site is zoned Office Professional (Voter Enacted) (O-P). Pursuant to MPMC Chapter 21.14, O-P – Office Professional Zone (Voter Enacted), the O-P Zone is intended to provide for the development of integrated professional, office and limited retail areas that exhibit a diversity of business activity from both revenue and service quality standpoints, and which are compatible and responsive to abutting land uses, including residential developments. As discussed in **Section 4.11: Land Use and Planning**, below, the Project would be consistent with the zoning for the Project Site, including the land use, FAR, height, and setback requirements, standards, and limits established in the MPMC for the O-P Zone. The Project is consistent with the land use designation and development density presented in the City's General Plan, and therefore would not exceed the population or job growth projections used by the SCAQMD to develop the AQMPs. Thus, the Project is consistent with the second criterion.

Based on these criteria, the Project would not conflict with or obstruct implementation of the AQMPs and impacts would be less than significant.

4.3b Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Less Than Significant Impact. As shown in **Table 4.3-2** above, the SoCAB is classified as non-attainment of the applicable NAAQS and or CAAQS for O_3 (precursor pollutants ROG and NO_X), PM10, PM2.5, and lead (for the Los Angeles County portion only, and is expected to be redesignated to attainment based on recent monitoring[9]). The SoCAB is classified as attainment, maintenance, or unclassifiable for all other criteria pollutants. Nonetheless, the analysis below discloses emissions and applicable thresholds for O_3 precursors, NO_2, PM10, PM2.5, CO, and SO_2.

[9] SCAQMD, National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) Attainment Status for South Coast Air Basin, https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/naaqs-caaqs-feb2016.pdf?sfvrsn=23. Accessed April 21, 2024.

Emissions of lead, hydrogen sulfide, sulfates, and vinyl chloride are not reported, because they would be minimal from the construction and operation of a data center.

Construction

Construction-generated emissions are short term and of temporary duration, lasting only as long as construction activities occur, but would be considered a significant air quality impact if the amount of pollutants generated exceeds the SCAQMD's thresholds of significance. Sources of emissions during construction include site grading, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces. Emissions of airborne particulate matter are largely dependent on the amount of ground disturbance associated with site preparation activities as well as weather conditions and the appropriate application of water. Sensitive land uses surrounding the Project Site consist mostly of residential communities located adjacent to the Project Site, including single-family residences to the north and west of the Project Site.

Construction-generated emissions associated with the Project were calculated using the CARB approved CalEEMod, which is designed to model emissions for land use development projects, based on typical construction requirements. See **Appendix A-1** and **Appendix A-2** for more information regarding the construction assumptions used in this analysis. Predicted maximum daily construction-generated emissions for the Project are identified in **Table 4.3-5: Project Construction Emissions**. The modeling emissions include truck idling time and emissions from heavy-duty diesel equipment.

Table 4.3-5: Project Construction Emissions

Calendar Year	Emissions (pounds per day)[1]					
	ROG	NO_X	CO	SO_2	PM10	PM2.5
2025	3.38	52.2	32.4	0.22	9.57	4.02
2026	1.39	11.6	17.9	0.03	1.35	0.69
2027	1.12	6.72	11.3	0.02	1.53	0.49
2027 (Offsite Improvements)[2]	3.88	26.73	27.05	0.10	0.99	0.91
SCAQMD Threshold	75	100	550	150	150	55
SCAQMD Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

1. Emissions were calculated using the CalEEMod version 2022.1.1.22, as recommended by the SCAQMD. Worst-case seasonal maximum daily emissions are reported. See **Appendix A-1** and **Appendix A-2** for model outputs.
2. Offsite improvement emissions were calculated using CalEEMod Appendix G, Table G-12. See **Appendix A-2** for model outputs.

The Project is subject to SCAQMD Rules 402, 403, and 1113, which prohibit nuisances, require dust mitigation, and limit VOC content in paints, respectively. It has been assumed that these rules will be followed using watering the site and low VOC paints during construction. In addition, the Project would follow Rule 1403 to limit asbestos emissions from building demolition. The Project may be required to comply with Rule 1466, *Control of Particulate Emissions from Soils with Toxic Air Contaminants.* The results of the emissions modeling, as summarized on **Table 4.3-5**, show that construction criteria pollutant emissions would remain below the applicable

thresholds, and construction impacts on short-term regional air quality would be less than significant.

Operations

The primary purpose of the data center is to house computer servers for data processing. Operational sources of emissions include mobile sources (i.e., motor vehicle use for employee commuting) and area sources (such as the use of landscape maintenance equipment, consumer products, and architectural coatings). In addition, the proposed Project would include up to 12 4-MW stationary emergency diesel generators that would only be used if there was a loss of grid power; and occasionally for periodic maintenance and testing.

Table 4.3-6: Project Operational Emissions summarizes the operational emissions attributable to the Project.

Table 4.3-6: Project Operational Emissions

Source	Emissions (pounds per day)[1]					
	ROG	NO_X	CO	SO_2	PM10	PM2.5
Area	7.54	0.09	10.5	<0.005	0.02	0.01
Energy[2]	0.00	0.00	0.00	0.00	0.00	0.00
Mobile	0.18	0.16	1.88	<0.005	0.46	0.12
Total	**7.72**	**0.25**	**12.38**	**0.01**	**0.48**	**0.13**
SCAQMD Threshold	55	55	550	150	150	55
SCAQMD Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

1. Emissions were calculated using the CalEEMod version 2022.1.1.22, as recommended by the SCAQMD. Worst-case seasonal maximum daily emissions are reported.
2. Criteria pollutant emissions from energy sources are calculated in CalEEMod from only natural gas use. The Project would not use natural gas.

As shown in **Table 4.3-6,** the Project's regional operational emissions would not exceed applicable SCAQMD thresholds, and operational impacts on long-term regional air quality would be less than significant.

The loss of electrical power from the grid is a hypothetical scenario. The Project Site is located in close proximity to a major SCE substation and construction activities include the installation of new and reliable power transmission facilities from the existing substation to the Project. In addition, SCE has confirmed sufficient power load and facilities to reliably service the Project. Hence, future power loss scenarios that could trigger the need for temporary use of the back-up generators are speculative, and therefore do not require further analysis herein.

Furthermore, the periodic testing and maintenance of the generators would be limited under the terms of SCAQMD operating permits to be obtained by the Applicant. Thus, the temporary emissions from the generators during testing and maintenance would be regulated by SCAQMD to ensure adherence to applicable thresholds and permit limits set by the regulating agency. As part of the regulatory compliance process, the Applicant will obtain Permits to Operate (PTO) from the SCAQMD before installation or operation of the emergency generators, which verifies that the generators meet the applicable Best Available Control Technology (BACT) requirements and comply with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal

Combustion and Other Compression Ignition Engines) and Rule 1401 (New Source Review of Toxic Air Contaminants). Thus, the facility would not result in a violation of the ambient air standards or result in exposure to TAC emissions in excess of thresholds.

Overall, during construction and operation, the Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

4.3c Would the project expose sensitive receptors to substantial pollutant concentrations?

Less Than Significant Impact.

Localized Construction Significance Analysis

The nearest sensitive receptors to the Project Site are multi-family residences located approximately 65 feet (approximately 20 meters) northwest of the Project Site. To assess potential impacts to nearby sensitive receptors, the SCAQMD established Localized Significance Thresholds (LSTs). LSTs were developed in response to SCAQMD Governing Boards' Environmental Justice Enhancement Initiative (I-4). The SCAQMD provided the *Final Localized Significance Threshold Methodology* (dated June 2003 [revised 2008]) to assist lead agencies in analyzing project-specific localized impacts. The SCAQMD established LSTs for certain pollutants with localized effects, specifically NO_X, CO, PM10, and PM2.5.

Since CalEEMod calculates construction emissions based on the number of equipment hours and the maximum daily soil disturbance activity possible for each piece of equipment, **Table 4.3-7: Equipment-Specific Grading Rates** is used to determine the maximum daily disturbed acreage for comparison to LSTs. A conversion from equipment number to the maximum daily disturbed acreage is calculated. The appropriate source receptor area (SRA) for the localized significance thresholds is the South San Gabriel Valley (SRA 11) area since this area includes the Project site. LSTs apply to CO, NO_2, PM10, and PM2.5. The SCAQMD produced look-up tables for projects that disturb areas less than or equal to 5 acres in size. Project construction is anticipated to disturb approximately 2.5 acres in a single day. As the LST guidance provides thresholds for projects disturbing 1-, 2-, and 5-acres in size and the thresholds increase with the size of the site, the LSTs for a 2.5-acre threshold were utilized for this analysis.

Table 4.3-7: Equipment-Specific Grading Rates

Construction Phase	Equipment Type	Equipment Quantity	Acres Graded per 8-Hour Day	Operating Hours per Day	Acres Graded per Day
Grading	Tractor	3	0.5	8	1.5
	Graders	1	0.5	8	0.5
	Dozers	1	0.5	8	0.5
Total Acres Graded Per Day					**2.5**

Source: CalEEMod version 2022.1.1.22.

As stated in the SCAQMD's *Finalized Localized Significance Threshold Methodology,* "off-site mobile emissions from the Project should not be included in the emissions compared to LSTs."

Therefore, for purposes of the construction LST analysis, only emissions included in the CalEEMod "on-site" emissions outputs were considered. The nearest sensitive receptors are the residences located approximately 65 feet (approximately 20 meters) northwest to the north of the Project site. LST thresholds are provided for distances to sensitive receptors of 25, 50, 100, 200, and 500 meters. Therefore, LSTs for 25 meters were utilized in this analysis. As discussed in Background on LST above, the closest receptor distance on the mass rate LST look-up tables is 25 meters. It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.[10] **Table 4.3-8: Localized Significance of Construction Emissions**, shows the results of localized emissions during construction activity. This table represents the worse-case scenario and are based on peak earthwork volumes anticipated. As shown in **Table 4.3-8,** localized Project construction emissions would not exceed SCAQMD thresholds, and impacts would be less than significant.

Table 4.3-8: Localized Significance of Construction Emissions

Source/Activity	Emissions (pounds per day)[1]			
	NO_X	CO	PM10	PM2.5
Construction Emissions[2]				
Phase 1 – Demolition (2025)	22.2	19.9	3.9	1.3
Phase 1 – Site Preparation (2025)	31.6	30.2	6.5	3.9
Phase 1 – Grading (2025)	16.3	17.9	2.6	1.6
Phase 1 – Building Construction and Utilities (2026)	9.85	13.0	0.38	0.35
Phase 1 – Paving (2026)	7.12	9.94	0.32	0.29
Phase 2 – Interior Construction (2026)	5.27	6.78	0.19	0.18
Phase 2 – Interior Construction (2027)	5.03	6.75	0.17	0.15
Phase 2 – Architectural Coating (2027)	0.83	1.13	0.02	0.02
Maximum Daily Emissions	*31.6*	*30.2*	*6.5*	*3.9*
SCAQMD Localized Screening Threshold (2.5 acres of disturbance at 25 meters)	131	1,162	8	6
Exceed SCAQMD Threshold?	**No**	**No**	**No**	**No**

1. Maximum emissions may not add up exactly due rounding in the modeling calculations. Detailed emissions calculations are provided in **Appendix A-1**.
2. SCAQMD Rule 403 Fugitive Dust applied for construction emissions. The Rule 403 reduction/credits include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces three times daily; water all haul roads three times daily; and limit speeds on unpaved roads to 15 miles per hour. Reductions percentages from the SCAQMD CEQA Handbook (Tables XI-A through XI-E) were applied. No mitigation was applied to construction equipment.

Source: CalEEMod version 2022.1.1.22. Refer to **Appendix A-1** for model outputs.

Localized Operational Impacts

According to the SCAQMD localized significance threshold methodology, operational LSTs apply to on-site sources. LSTs for receptors located at approximately 25 meters for SRA 11 were utilized

[10] SCAQMD, Localized Significance Threshold Methodology, July 2008, https://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf. Accessed April 22, 2024.

in this analysis. Although the Project Site is 15.8 acres, the 5-acre LST threshold was conservatively used because a smaller size LST threshold is more conservative. Therefore, the 5-acre LSTs is a conservative evaluation of a 15.8 acre site.

The on-site operational emissions were calculated using CalEEMod and are compared to the LSTs in **Table 4.3-9: Localized Significance of Operational Emissions**. The operational emissions shown in **Table 4.3-9** include on-site Project-related sources as discussed above. As shown in **Table 4.3-9**, the Project would not generate localized emissions during Project operations. Therefore, the Project would result in a less than significant impact concerning LSTs during operational activities.

Table 4.3-9: Localized Significance of Operational Emissions

Source/Activity	Emissions (pounds per day)[1]			
	NO_X	CO	PM10	PM2.5
Operational Emissions				
On-Site Emissions (Area + Energy Sources)	7.54	10.5	0.02	0.01
SCAQMD Localized Screening Threshold (5-acre site at 25 meters)	131	1,162	2	2
Exceed SCAQMD Threshold?	**No**	**No**	**No**	**No**

1. Emissions were calculated using the California Emissions Estimator Model version 2022.1.1.20 (CalEEMod), as recommended by the SCAQMD. Worst-case seasonal maximum daily emissions are reported.

Source: CalEEMod version 2022.1.1.22. Refer to **Appendix A-1** for model outputs.

Criteria Pollutant Health Impacts

On December 24, 2018, the California Supreme Court issued an opinion identifying the need to provide sufficient information connecting a project's air emissions to health impacts or explain why such information could not be ascertained (*Sierra Club v. County of Fresno* [Friant Ranch, L.P.] [2018] Cal.5th, Case No. S219783).

The Project would generate certain air pollutants during construction and operation. The criteria pollutants would include ROG/VOC, NO_X, CO, SO_2, PM10, and PM2.5 that can have adverse impacts on human health at certain levels of exposure. Here, the Project does not result in any significant air quality impacts, or create levels of exposure that would have significant effects on human health. All impacts are less than significant based on quantitative air quality modeling. Moreover, the state of environmental science modeling at this time is not capable of identifying precisely how pollutant concentrations from individual projects correlate directly or indirectly to the level of human health impacts.[11] It should also be noted that the Project emissions are well below the applicable air emission thresholds of significance, which are created by the air districts, in part, to evaluate the potential impacts of criteria pollutants on human health.

The SCAQMD has set its CEQA significance thresholds based on the FCAA, which defines a major stationary source (in extreme ozone nonattainment areas such as the SoCAB) as emitting 10 tons per year. The thresholds correlate with the trigger levels for the federal New Source Review (NSR)

[11] Air Quality and Health Effects, Sierra Club v County of Fresno, White Paper, October 2019.

Program and SCAQMD Rule 1303 for new or modified sources. The NSR Program[12] was created by the FCAA to ensure that stationary sources of air pollution are constructed or modified in a manner that is consistent with attainment of health-based NAAQS. The NAAQS establish the levels of air quality necessary, with an adequate margin of safety, to protect the public health. Therefore, projects that do not exceed the SCAQMD's LSTs and mass emissions thresholds would not violate any air quality standards or contribute substantially to an existing or projected air quality violation and no criteria pollutant health impacts.

As previously discussed, localized effects of on-site Project emissions on nearby receptors were found to be less than significant (refer to **Table 4.3-8** and **Table 4.3-9**). The LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable State or federal ambient air quality standard. The LSTs were developed by the SCAQMD based on the ambient concentrations of that pollutant for each SRA and distance to the nearest sensitive receptor. The CAAQS and NAAQS establish the levels of air quality necessary, with an adequate margin of safety, to protect public health, including protecting the health of sensitive populations. Information on health impacts related to exposure to ozone and particulate matter emissions published by the U.S. EPA and CARB have been summarized above and discussed in the Regulatory Setting section. As shown above, Project-related emissions would not exceed the regional thresholds or the LSTs, and therefore would not exceed the CAAQS or NAAQS or cause an increase in the frequency or severity of existing violations of air quality standards. Therefore, sensitive receptors would not be exposed to criteria pollutant levels in excess of the health-based CAAQS or NAAQS.

Carbon Monoxide Hotspots

An analysis of CO "hot spots" is needed to determine whether the change in the level of service of an intersection resulting from the Project would have the potential to result in exceedances of the CAAQS or NAAQS. It has long been recognized that CO exceedances are caused by vehicular emissions, primarily when vehicles are idling at intersections. Vehicle emissions standards have become increasingly stringent in the last 20 years. Currently, the CO standard in California is a maximum of 3.4 grams per mile for passenger cars (requirements for certain vehicles are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities, CO concentrations have steadily declined. Accordingly, with the steadily decreasing CO emissions from vehicles, even very busy intersections do not result in exceedances of the CO standard.

The SoCAB was re-designated as attainment in 2007 and is no longer addressed in the SCAQMD's AQMP. The 2003 AQMP is the most recent version that addresses CO concentrations. As part of the SCAQMD *CO Hotspot Analysis*, the Wilshire Boulevard/Veteran Avenue intersection, one of the most congested intersections in Southern California with an average daily traffic ("ADT") volume of approximately 100,000 vehicles per day, was modeled for CO concentrations. This modeling effort identified a CO concentration high of 4.6 ppm, which is well below the 35-ppm Federal standard. The Project considered herein would not produce the volume of traffic

[12] Code of Federal Regulation (CFR) [i.e., PSD (40 CFR 52.21, 40 CFR 51.166, 40 CFR 51.165 (b)), Non-attainment NSR (40 CFR 52.24, 40 CFR 51.165, 40 CFR part 51, Appendix S).

required to generate a CO hot spot in the context of SCAQMD's *CO Hotspot Analysis*. As the CO hotspots were not experienced at the Wilshire Boulevard/Veteran Avenue intersection even as it accommodates 100,000 vehicles daily, it can be reasonably inferred that CO hotspots would not be experienced at any vicinity intersections as the Project would result in 52 daily trips.[13] Therefore, impacts would be less than significant.

Carcinogenic Risk

Construction-related activities would result in Project-generated emissions of diesel particulate matter ("DPM") from the exhaust of off-road, heavy-duty diesel equipment for site preparation (e.g., clearing, grading); paving; application of architectural coatings; on-road truck travel; and other miscellaneous activities. For construction activity, DPM from the exhaust of off-road, heavy-duty diesel equipment is the primary toxic air contaminant of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations. As such, the diesel exhaust from construction equipment operating at the site could potentially pose a health risk to nearby sensitive receptors.

Table 4.3-10: Construction Carcinogenic Risk Assessment shows the health risk for the construction of the Project. The analysis calculates risk based on exposure to construction concentrations during the entire two years of construction.

Table 4.3-10: Construction Carcinogenic Risk Assessment

Exposure Scenario	Cancer Risk (Risk per Million)[1]	Significance Threshold (Risk per Million)	Exceeds Significance Threshold?
Residential Receptors	2.49	10	No
Worker Receptor	0.11	10	No

1. The reported annual pollutant concentration is at the closest maximally exposed individual resident (MEIR) to the Project Site.

Source: Refer to **Appendix B**.

As shown in **Table 4.3-10**, the construction risk at the residential and worker receptors would be 2.49 in one million and 0.11 in one million, respectively. The incremental cancer risk would be less than those levels for receptors at distances further from the site. As such, the maximum cancer risk would be far below the SCAQMD threshold of 10 per million, and impacts associated with carcinogenic risk would therefore be less than significant.

Table 4.3-11: Population Construction Cancer Burden shows the population cancer burden for the construction of the Project.

Table 4.3-11: Population Construction Cancer Burden

Burden	Significance Threshold	Exceeds Significance Threshold?
0.0002	0.5	No

Source: Refer to **Appendix B**.

[13] Kimley-Horn and Associates, Inc., Transportation Analysis and Vehicle Miles Traveled Screening, April 5, 2024.

According to OEHHA, cancer burden, defined as the number of increased cancer cases expected in a population of one million, is used to assess public health impacts on a larger scale. Emissions of Project-generated DPM disperses, and concentration dissipates, rapidly with distance from the Project Site boundary. The residential receptors in Figure 1 of **Appendix B** are closest to the Project Site and would be the maximum receptor locations during construction.

In addition, Figure 2 of **Appendix B** provides a zone of impact screening isopleth that illustrates where total excess lifetime cancer risk exposure could be greater than 1 in 1,000,000, which is the screening criteria per OEHHA and SCAQMD for further analysis of the total cancer burden.

To be clear, this isopleth is highly conservative because it identifies the zone of potential impact over a 70-year lifetime exposure, and the Project construction duration is only approximately two years. Nonetheless, this report quantitatively analyzed the cancer burden within the zone of impact. As shown in Figure 2, the cancer burden for all receptors within the isopleth outline is well below the applicable SCAQMD threshold.

Quantitatively, the total cancer burden is the product of the number of persons in a residential population area and the estimated individual risk. As shown in Table 4.3-11, total cancer burden would be 0.0002, which is far below the SCAQMD's 0.5 cancer burden threshold. In addition, this modeled exposure scenario is temporary and ceases upon construction completion. Therefore, community-wide exposure to TACs from the Project would not result in a cancer burden of 0.5 or greater, and impacts would be less than significant.

Accordingly, the Project would not expose sensitive receptors to substantial pollutant concentrations.

Non-Carcinogenic Hazard

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. RELs are designed to protect sensitive individuals within the population. According to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system.[14]

Chronic non-carcinogenic impacts are shown in **Table 4.3-12: Construction Chronic Hazard Assessment**. A chronic HI of 1.0 is considered individually significant. The hazard index is calculated by dividing the chronic exposure by the reference exposure level. The chronic hazard was calculated based on the highest annual average concentration at the maximally exposed individual receptor. It should be noted that there is no acute REL for DPM and acute health risk cannot be calculated. The highest maximum chronic hazard index associated with DPM emissions from Project construction would be 0.0030 and 0.0021 at the residential and worker receptors,

[14] California Office of Environmental Health Hazard Assessment, OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary, https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary. Accessed March 26, 2024.

respectively. Therefore, construction non-carcinogenic hazard would be far below, and not exceed the acceptable limits of 1.0 and impacts would be considered less than significant.

Table 4.3-12: Construction Chronic Hazard Assessment

Exposure Scenario	Annual Concentration (µg/m^3)[1]	Chronic Hazard
Residential Receptors	0.0150	0.0030
Worker Receptors	0.0150	0.0021
SCAQMD Threshold	*N/A*	*1.0*
Threshold Exceeded?	**N/A**	**No**

1. The reported pollutant concentration is at the closest receptor (maximally exposed individual receptor).
Source: Refer to **Appendix B**.

Operational Health Risk Analysis

Operational emissions from the Project would result from mobile sources (i.e., motor vehicle use) and area sources (such as the use of landscape maintenance equipment, consumer products, and architectural coatings). As discussed in the Air Quality Assessment (**Appendix A-1**), the majority of these emissions would be generated by diesel and gasoline-powered vehicle travel occurring off-site from light-duty vehicles trips by staff to and from the Project site. Light duty vehicles are not substantial sources of TAC emissions (e.g., DPM), which are primarily associated with diesel fueled vehicles.

The Project would include up to 12 4-MW stationary emergency diesel generators, which would only be used upon hypothetical loss of grid power, and for periodic maintenance and testing, which is regulated by the SCAQMD permit process. As discussed above, as part of the regulatory compliance process, the Applicant will obtain PTO from the SCAQMD before installation or operation of the emergency generators, which verifies that the generators meet the applicable BACT requirements and comply with SCAQMD Rule 1470 and Rule 1401, which would minimize TAC emissions. An operational health risk analysis would be required to comply with SCAQMD's Rule 1401 permit requirements. Before the generators can operate, DPM emissions and cancer risk associated with the proposed diesel generators would be regulated by the SCAQMD permit process to ensure that associated emission levels remain less than significant.

4.3d Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less Than Significant Impact.

Construction

Odors that could be generated by construction activities are required to follow SCAQMD Rule 402 to prevent odor nuisances on sensitive land uses. SCAQMD Rule 402, Nuisance, states:

> *A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort,*

repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

Odors may be generated during construction activities such as, equipment diesel exhaust, architectural coatings volatile organic compounds, and paving activities. However, these odors would be temporary, are not expected to affect a substantial number of people and would disperse rapidly. Therefore, impacts related to odors associated with the Project's construction-related activities would be less than significant.

Operations

The SCAQMD CEQA Air Quality Handbook identifies certain land uses as sources of odors. These land uses include agriculture (farming and livestock), wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding. The Project would not include any of the land uses that have been identified by the SCAQMD as odor sources. Therefore, the Project would not create objectionable odors and no impact would occur.

4.4 Biological Resources

This Section is based on the *Tree Evaluation Report* (Arborgate Consulting, Inc., July 2024), which is included as **Appendix C: Tree Evaluation Report**.

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?			X	
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?				X
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?				X
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?			X	
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?			X	
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?				X

Impact Analysis

4.4a Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Less Than Significant Impact. The Project Site is occupied by an existing commercial office building, associated utility building, and associated surface parking lot. The Project Site contains

ornamental landscaping, including several mature ornamental trees. The Project Site is in an urbanized area of the City and is surrounded by office, residential, and utility uses.

A review of the California Department of Fish and Wildlife ("CDFW") California Natural Biodiversity Database ("CNDDB") QuickView Tool found 14 threatened or endangered wildlife species in the El Monte Quadrangle, which is the Project Site's quadrangle.[15] The 14 species include the following:

Birds

- Swainson's Hawk (*Buteo swainsoni*)
- Western Yellow-billed Cuckoo (*Coccyzus americanus occidentalis*)
- Bank Swallow (*Riparia riparia*)
- Light-footed Ridgways Rail (*Rallus obsoletus levipes*)
- Willow Flycatcher (*Empidonax traillii*)
- Southwestern Willow Flycatcher (*Empidonax traillii extimus*)
- Least Bells Vireo (*Vireo bellii pusillus*)
- Coastal California Gnatcatcher (*Polioptila californica californica*)

Amphibians

- Western Spadefoot (*Spea hammondii*)

Insects

- Crotchs Bumble Bee (*Bombus crotchii*)

Fish

- Santa Ana Sucker (*Catostomus santaanae*)

Reptiles

- Western Pond Turtle (*Emys marmorata*)

Plants - Vascular

- Nevins Barberry (*Berberis nevinii*)
- Slender-horned Spineflower (*Dodecahema leptoceras*)

There is currently no native habitat within or near the Project Site to support the listed species above. The Project Site is either out of range for these species or would not provide suitable habitat due to its highly disturbed nature and the fact that the Project Site is located in a highly urbanized area. Additionally, no natural biological resources or communities are present within, adjacent to, or in the vicinity of the Project Site.

Furthermore, according to the Tree Evaluation Report prepared for the Project, 337 trees are currently located on-site. However, none of these tree species are rare or endangered, and only

[15] California Department of Fish and Wildlife (CDFW), California Natural Biodiversity Database QuickView Tool, 2023, https://apps.wildlife.ca.gov/bios6/?tool=cnddbqv. Accessed March 26, 2024.

one of the tree species (California sycamore, *Platanus racemosa*) is native or naturally occurring in California. None of the trees are naturally occurring on the Project Site.[16]

Therefore, the Project would not result in a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations. A less than significant impact would occur.

4.4b Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

4.4c Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

No Impact. According to the United States Fish and Wildlife Service ("USFWS") National Wetlands Inventory, no riparian habitats or wetlands are present on or adjacent to the Project Site.[17] The nearest identified wetland is a freshwater pond located approximately one mile southwest of the Project Site in the City of Montebello. Therefore, the Project would not have an adverse effect on riparian habitat or other sensitive natural community or on state or federally protected wetlands. No impact would occur in this regard.

4.4d Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less Than Significant Impact. The Project Site is fully developed, surrounded by urban development, and is not part of an established wildlife corridor. Project development would occur within the Project Site and would not impact the movement of any native wildlife species.

The Project site contains ornamental landscaping and trees along the perimeter of the Project Site and throughout the parking lot. It is unlikely that the smaller trees, grasses, and shrubs on-site would provide suitable habitat for any native resident or wildlife species. However, the existing mature trees may provide habitat for nesting birds. Most bird nests and eggs are protected under the California Fish and Game Code ("CFGC") Section 3503 and the Migratory Bird Treaty Act ("MBTA"). Project construction activities and tree maintenance activities should occur outside of the general avian breeding season of February 1st to through August 31st to the extent feasible. If Project-related construction, demolition, and tree maintenance activities cannot occur outside of the general avian breeding season (February 1st to through August 31st), a pre-activity nesting bird survey will be conducted before the onset of the aforementioned activities, within a maximum of 14 days before commencement. The survey will be conducted by a qualified biologist as determined by the City. The survey will be conducted within all suitable nesting habitat located within the area of activity, which includes a 250-foot survey buffer around

[16] Arborgate Consulting, Inc, Tree Evaluation Report, 2024.
[17] United States Fish and Wildlife Service, National Wetlands Inventory, 2021, https://fwsprimary.wim.usgs.gov/wetlands/apps/wetlands-mapper/. Accessed on February 7, 2024.

the Project Site to account for all potentially nesting birds on and in the immediate vicinity. If no nesting birds are found, the Project-related activities may commence without potential impacts to nesting birds. Therefore, with compliance with CGFC Section 3503 and the MBTA, the Project would have a less than significant impact on the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

4.4e Would the project conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less Than Significant Impact. As discussed in the Tree Evaluation, permission to remove or prune trees along Saturn Street must be obtained, if needed, by the City. Provisions for the removal and planting of trees and landscaping in public property is addressed in MPMC section 9.63.060, Tree Removal Permit, which requires that persons desiring to remove trees from public property abutting property they own or occupy apply for a tree removal permit. MPMC Section 9.63.050, Permit, also requires a permit for the planting of any trees in any portion of a public street or within five feet of any curb or sidewalk.

The City does not regulate the preservation of trees on private property. A number of existing trees will be removed to accommodate the Project. For instance, most of the carrotwood trees on-site within the existing parking lot would be removed to accommodate the proposed data center building. However, most of the existing trees on-site are in declining health due to several years of hard low-bid pruning, poor soil compaction and turf management, and/or lack of root space. Therefore, a number of trees will also be removed due to poor health and structure. Other trees in poor health would be replaced, maintained and properly pruned, or further analyzed in a risk assessment.

Pursuant to the pertinent regulations as described above, the Project would be required to apply for tree removal and planting permits for the removal and planting of street trees, specifically. Upon the City's approval of and implementation of the tree removal and planting permits for street trees, the Project would not conflict with local policies or ordinances protecting biological resources, and impacts would be less than significant.

4.4f Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Impact. No portions of the City are located within the boundaries of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.[18] [19] Therefore, the Project would not result in conflicts with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan, and no impact would occur.

4.5 Cultural Resources

This Section is based on the *Cultural Resources Assessment* (CRA) (BCR Consulting, LLC, July 2024), and Assembly Bill 52 Communications, which are included as **Appendix D Cultural Resources Assessment** and **Appendix L: Assembly Bill 52 Communications**, respectively.

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?				X
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?		X		
c) Disturb any human remains, including those interred outside of dedicated cemeteries?			X	

Impact Analysis

4.5a Would the project cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?

No Impact. CEQA Guidelines Section 15064.5(a) generally defines a historic resource as a resource that is: (1) listed in, or eligible for listing in the California Register of Historic Resources (California Register); (2) listed in a local register of historical resources (as defined in Section 5020.1(k) of the PRC); (3) identified as significant in a historical resources survey meeting the criteria in Section 5024.1(g) of the PRC; and/or (4) determined to be a historical resource by a project's lead agency. Additionally, any object, building, structure, site, area, place, record, or manuscript which a Lead Agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered a historical resource, provided the Lead Agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource is considered by the Lead Agency to be historically significant if the resource meets the criteria for listing on the California Register.

The Project Site is currently developed with an existing commercial office building, utility building, parking lot, and ornamental trees and landscaping. The State-recommended threshold under which buildings may be considered historic resources is a construction age of 50 years. In order that the CRA's evaluation remain valid for a minimum of five years after the date of the CRA, all resources older than 45 years (i.e., resources from the historic period) were evaluated for listing eligibility in the California Register, or CEQA significance.[20]

[20] BCR Consulting, LLC, Cultural Resources Assessment, 2024.

The existing commercial office building was originally constructed in 1979 for use as a corporate office. While the building is historic in age, research failed to associate it with important events related to the development of the area (California Register Criterion 1); failed to associate it with the lives of any persons important to local, California, or U.S. History (California Register Criterion 2); is not distinctive from other office buildings of that era and does not embody any distinctive characteristics, nor does it represent the work of an important creative individual or possess high artistic values (California Register Criterion 3); and has not and is not likely to yield information important to prehistory or history (California Register Criterion 4). Therefore, the Project Site and its historic-period buildings are not eligible under any of the four criteria for listing on the California Register of Historical Resources, and as such are not recommended historical resources under CEQA. There are no other historical resources or resources with the potential for historical significance on-site. Therefore, the Project would not cause a substantial adverse change in the significance of a historical resource, and no impact would occur.

4.5b Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

Less Than Significant Impact with Mitigation Incorporated. The cultural resources records search conducted for the CRA at the South Central Costal Information Center ("SCCIC") identified 12 cultural resources studies that have previously taken place within a 0.5-mile radius of the Project Site, with one study assessing the Project Site. That study resulted in no cultural resources having been recorded within its boundaries.

An on-site pedestrian survey conducted in February 2024 did not identify artifacts or potential for significant buried remains. No other cultural resources (including prehistoric or historic archaeological or historic architectural resources) were identified during the field survey. Disturbances associated with previous excavation and construction of the existing commercial office building at the Project Site have been severe and have disrupted soil beyond depths at which buried cultural resources are likely. Therefore, the potential to encounter in-situ remains associated with significant archaeological materials during Project activities is low. Nevertheless, ground-disturbing activities have the potential to reveal buried deposits not observed on the surface during previous surveys. To mitigate such impacts, the Project would be required to implement **Mitigation Measure (MM) CUL-1**, which sets forth procedures for inadvertent discovery of archaeological resources. Implementation of **MM CUL-1** would reduce Project impacts to archaeological resources to a less than significant level.

4.5c Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

Less Than Significant Impact. Given the Project Site has been subject to extensive disruption, the potential to disturb or impact any human remains is unlikely. However, there is always a possibility that that human remains could be interred beneath the Project Site. If human remains were found, those remains would require proper treatment in accordance with applicable laws. PRC Section 5097, et seq., and California State Health and Safety Code ("HSC") Sections 7050.5-7055 describe the general provisions regarding human remains, including the requirements if any human remains are accidentally discovered during excavation of a site. The requirements and

procedures set forth in PRC Section 5097.98 would be implemented if human remains are discovered, including notification of the County Coroner, notification of the NAHC if the remains are determined to be prehistoric, and consultation with the individual identified by the NAHC to be the "most likely descendant." If human remains are found during excavation, the Project will comply with California State HSC Section 7050.5 in which excavation must stop within 50 feet of the discovery until the County Coroner has made a determination of origin and disposition of the remains pursuant to PRC Section 5097.98 and appropriate recommendations have been made for the treatment and disposition of the remains. Compliance with the established regulatory framework would ensure the proper treatment of human remains should they be encountered. Therefore, the Project would result in less than significant impact concerning the potential to disturb any human remains.

Mitigation Measures

MM CUL-1 In the event that archaeological resources are unexpectedly encountered during ground-disturbing activities, work within 50 feet of the find must halt and an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (National Park Service 1983) ("qualified archaeologist") must be contacted immediately to evaluate the resource. If the resource is determined by the qualified archaeologist to be prehistoric, a Native American representative must also be contacted to participate in the evaluation of the resource. If the qualified archaeologist and/or Native American representative determines it to be appropriate, archaeological testing for CRHR eligibility must be completed. If the resource proves to be eligible for the CRHR and significant impacts to the resource cannot be avoided via Project redesign, a qualified archaeologist will prepare a data recovery plan tailored to the physical nature and characteristics of the resource, per the requirements of the California Code of Regulations (CCR) Guidelines Section 15126.4(b)(3)(C). The data recovery plan will identify data recovery excavation methods, measurable objectives, and data thresholds to reduce any significant impacts to cultural resources related to the resource. Pursuant to the data recovery plan, the qualified archaeologist and Native American representative, as appropriate, must recover and document the scientifically consequential information that justifies the resource's significance. The City will review and approve the treatment plan and archaeological testing as appropriate, and the resulting documentation must be submitted to the regional repository of the California Historical Resources Information System, per CEQA Guidelines Section 15126.4(b)(3)(C).

4.6 Energy

This Section is based on the Energy Calculations, which are included in **Appendix A-2: Offsite Improvements for Southern California Edison Service** and **Appendix E: Energy Calculations**.

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?			X	
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?			X	

Regulatory Setting

State

California's Energy Efficiency Standards for Residential and Non-Residential Buildings (Title 24)

Energy conservation standards for new residential and nonresidential buildings were adopted by the California Energy Resources Conservation and Development Commission (now the California Energy Commission ("CEC")) in June 1977 and are updated every three years (CCR Title 24, Part 6). Title 24 requires the design of building shells and building components to conserve energy. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods.

On August 11, 2021, the CEC adopted the 2022 Energy Code. In December, it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. Among other updates like strengthened ventilation standards for gas cooking appliances, the 2022 Energy Code includes updated standards in three major areas:

- New electric heat pump requirements for residential uses, schools, offices, banks, libraries, retail, and grocery stores.
- The promotion of electric-ready requirements for new homes including the addition of circuitry for electric appliances, battery storage panels, and dedicated infrastructure to allow for the conversion from natural gas to electricity.
- The expansion of solar photovoltaic and battery storage standards to additional land uses including high-rise multifamily residences, hotels and motels, tenant spaces, offices, (including medical offices and clinics), retail and grocery stores, restaurants, schools, and civic uses (including theaters auditoriums, and convention centers).

The California Green Building Standards Code (California Code of Regulations, Title 24, Part 11), commonly referred to as the CALGreen Code, is a Statewide mandatory construction code that was developed and adopted by the California Building Standards Commission and the California

Department of Housing and Community Development. CALGreen standards require new residential and commercial buildings to comply with mandatory measures under five topical areas: planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental quality. CALGreen also provides voluntary measures (CALGreen Tier 1 and Tier 2) that local governments may adopt which encourage or require additional measures in the five green building topics. The most recent update to the CALGreen Code was adopted in 2022 and went into effect January 1, 2023. Projects whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.[21]

Renewable Portfolio Standard

In 2002, California established its Renewable Portfolio Standard (RPS) program[22] with the goal of increasing the annual percentage of renewable energy in the State's electricity mix by the equivalent of at least 1 percent of sales, with an aggregate total of 20 percent by 2017. Since then various pieces of legislation have provided further goals. Signed in 2018, SB 100 revised the program's goal to achieve the 50 percent renewable resources target by December 31, 2026, and a 60 percent renewable resources target by December 31, 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045. Under the bill, the State cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

Low Carbon Fuel Standard

The Low Carbon Fuel Standard (LCFS), established in 2007 through Executive Order S-1-07 and administered by CARB, requires producers of petroleum-based fuels to reduce the carbon intensity of their products, starting with 0.25 percent in 2011 and culminating in a 10-percent total reduction in 2020. Petroleum importers, refiners and wholesalers can either develop their own low carbon fuel products or buy LCFS credits from other companies that develop and sell low carbon alternative fuels, such as biofuels, electricity, natural gas and hydrogen.

CARB Scoping Plan

Adopted December 15, 2022, CARB's 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. To achieve the targets of AB 1279, the 2022 Scoping Plan relies on existing and emerging fossil fuel alternatives and clean technologies, as well as carbon capture and storage. Specifically, the 2022 Scoping Plan focuses on zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high global warming potential (GWP); providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel fired electrical generation through use of renewable energy

[21] California Energy Commission, 2022 Building Energy Efficiency Standards, https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency. Accessed February 18, 2024.

[22] The Renewable Portfolio Standard is a flexible, market-driven policy to ensure that the public benefits of wind, solar, biomass, and geothermal energy continue to be realized as electricity markets become more competitive. The policy ensures that a minimum amount of renewable energy is included in the portfolio of electricity resources serving a state or country.

alternatives (e.g., solar arrays and wind turbines); and scaling up new options such as green hydrogen.

The key elements of the 2022 CARB Scoping Plan focus on transportation. Specifically, the 2022 Scoping Plan aims to rapidly move towards zero-emission transportation (i.e., electrifying cars, buses, trains, and trucks), which constitutes California's single largest source of GHGs. The regulations that impact the transportation sector are adopted and enforced by CARB on vehicle manufacturers and are outside the jurisdiction and control of local governments. The 2022 Scoping Plan accelerates development of new regulations as well as amendments to strengthen regulations and programs already in place.

Impact Analysis

4.6a Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less Than Significant Impact.

Southern California Edison (SCE) provides electricity to the Project area. Total electricity demand in SCE's service area is forecast to increase by approximately 8,000 GWh—or 8 billion kWh—between 2024 and 2030.[23]

Construction

The energy consumption associated with Project construction includes primarily diesel fuel consumption from on-road hauling trips and off-road construction diesel equipment, and gasoline consumption. Temporary electric power for as-necessary lighting and electronic equipment (such as computers inside temporary construction trailers, and heating, ventilation, and air conditioning) would be powered by a generator or temporary pole power. The amount of electricity used during construction would be minimal; typical demand would stem from the use of electrically powered hand tools and several construction trailers by managerial staff during the hours of construction activities. The majority of the energy used during construction would be from petroleum (e.g., gasoline and diesel).

Construction activity is anticipated to occur over a duration of approximately two years, beginning as early as September 2025 and ending as early as August 2027. The energy associated with Project construction includes electricity use associated with water utilized for dust control, diesel fuel from on-road hauling trips, vendor trips, and off-road construction diesel equipment, as well as gasoline fuel from on-road worker commute trips. Because construction activities typically do not require natural gas, it is not included in the following discussion. The methodology for each category is discussed below. Quantifications of construction energy are provided by the Project below; see **Table 4.6-1: Energy Use During Construction**.

[23] California Energy Commission, California Energy Demand 2018-2030 Revised Forecast, Figure 49 Historical and Projected Baseline Consumption SCE Planning Area, 2018, https://www.enreergy.ca.gov/data-reports/reports/integrated-energy-policy-report/2017-integrated-energy-policy-report/2017-iepr. Accessed February 18, 2024.

Table 4.6-1: Energy Use During Construction			
Source	**Project Construction Usage**	**Los Angeles County Annual Energy Consumption**	**Percentage of Countywide Consumption**
Electricity Use		**GWh**	
Water Consumption[1]	0.05	68,485	0.0001%
Diesel Use		**Gallons**	
On-Road Construction Trips[2]	32,062	4,129,527,647	0.0008%
Off-Road Construction Equipment[3,4]	56,608	4,129,527,647	0.0014%
Construction Diesel Total	88,670	4,129,527,647	0.0021%
Gasoline		**Gallons**	
On-Road Construction Trips[2]	14,965	4,129,744,580	0.0004%

1. Construction water use based on acres disturbed per day per construction sequencing and estimated water use per acre. Water use includes the energy required to convey water to and from the Project Site.
2. On-road mobile source fuel use based on vehicle miles traveled (VMT) from CalEEMod and fleet-average fuel consumption in gallons per mile from EMFAC2021 in Los Angeles County.
3. Off-road mobile source fuel usage based on a fuel usage rate of 0.05 gallons of diesel per horsepower (hp)-hour from USEPA.
4. As discussed in **Appendix A-2**, the six pieces of equipment used for the offsite improvements for SCE service would result in a negligible increase in energy usage and would not require increased demand or capacity.

Source: Refer to the energy calculations in **Appendix E**.

Electricity

The Project's electrical demand is expected to be served by existing SCE electrical facilities. The Project's construction-related electrical demand would total approximately 0.0507 GWh. This would represent 0.0001 percent of SCE's forecast 2025 increased demand. Therefore, Project construction would not result in wasteful, inefficient, or unnecessary consumption of electrical resources.

Fuel

During Project construction, transportation energy use would depend on the type and number of trips, vehicle miles traveled (VMT), fuel efficiency of vehicles, and travel mode. Transportation energy use during construction would be from transport and use of construction equipment, delivery vehicles and haul trucks, and construction employee vehicles that would use diesel fuel/gasoline. The use of energy resources by these vehicles would fluctuate according to the construction phase and would be temporary. Project construction would total approximately 88,670 gallons of diesel and 14,965 gallons of gasoline. As shown above in **Table 4.6-1**, the proposed Project's fuel from the entire construction period would increase fuel use in the county by approximately 0.021 percent of diesel and 0.0004 percent of gasoline.

Impacts related to transportation energy use during Project construction would be temporary and would not require expanded energy supplies or construction of new infrastructure. Therefore, Project construction would not result in wasteful, inefficient, or unnecessary fuel consumption.

Operations

The energy consumption associated with Project operations would occur from building energy (electricity) use, water use, and transportation-related fuel use. Annual Energy use during Project operation is shown in **Table 4.6-2: Annual Energy Consumption During Operations**.

Table 4.6-2: Annual Energy Consumption During Operations

Source	Project Operational Usage	Los Angeles County Annual Energy Consumption	Percentage Increase Countywide
Electricity Use	**GWh**		
Building Energy[1]	438.01	68,485	0.6396%
Water Conveyance	0.08		0.0001%
Natural Gas Use[2]	**Therms/Year (therms/year)**		
Area	0	0	0
Diesel Use	**Gallons/Year**		
Mobile[3]	1,018	535,939,687	0.0002%
Emergency Generators[4]	198,812		0.0371%
Gasoline Use	**Gallons/Year**		
Mobile[2]	10,172	3,369,809,065	0.0003%

1. The electricity and natural gas usage are based on Project-specific estimates and CalEEMod defaults. The Project during peak load conditions would have a demand of 49,999 kilowatts per hour (KW/h). The analysis assumes 24/7 operations (8,760 hours per year) which would result in a maximum electrical usage of 437,991 megawatt hours (MWh) per year. Plus CalEEMod default assumptions for lighting for surface parking (23.3 MWh) for a total of 438,015 MWh or 438.01 GWh annually.
2. The Project is not anticipated to use natural gas.
3. Calculated based on the mobile source fuel use based on vehicle miles traveled (VMT) and fleet-average fuel consumption (in gallons per mile) from EMFAC2021 for operational year 2027.
4. Assumed 14 emergency generators each used up to 50 hours per year for testing and maintenance with a 277 gallon per hour fuel flow.

Source: Refer to the energy calculations in **Appendix E**.

Electricity

The Project's estimated operational electrical demand would total approximately 438 GWh per year. SCE'S forecasted increase in demand for its services area by 2026 is 110,690 GWh.[24] Thus, this Project would represent 0.64 percent of SCE's forecast 2026 demand, thus, would result in a negligible increased demand compared to SCE's overall demand. In addition, SCE evaluated the anticipated electricity demand for the Project and concluded that SCE has adequate energy supply to efficiently serve the Project. It is also noted that the Project (i.e., design and materials) would be subject to compliance with the 2022 Building Energy Efficiency Standards. The Project would also be required to comply with CALGreen, which establishes planning and design standards for sustainable site development, energy efficiency (more than California Energy Code requirements), water conservation, material conservation, and internal air contaminants.

[24] California Energy Commission, California Energy Demand Forecast, 2021-2035, Electricity Consumption by Sector (Total Consumption), https://www.energy.ca.gov/data-reports/reports/integrated-energy-policy-report/2021-integrated-energy-policy-report/2021-1. Accessed August 16, 2024.

The primary purpose of the data center is to house computer servers; therefore, the uses typically associated with data centers are storing and processing data, which consumes energy. It should also be noted that the Project is anticipated to have a blended Power Usage Effectiveness ("PUE") of 1.2 due to free cooling modules on the air-cooled chillers. This PUE rating is better the average PUE for data centers, which indicates that the Project would not result in the wasteful or inefficient use of energy. The Project would be more energy efficient than the average data center. Due to energy efficiency measures incorporated into the facility, Project operations would not result in wasteful, inefficient, or unnecessary consumption of energy, or wasteful uses of electricity resources.

Natural Gas

Southern California Gas Company (SoCalGas) provides natural gas to the Project area. Natural gas is currently not used at the Project Site. The proposed Project would not use natural gas during operations. Therefore, Project construction and operations would not result in wasteful, inefficient, or unnecessary consumption of natural gas resources.

Fuel

As shown in **Table 4.6-2**, during Project operations, diesel fuel consumption would be approximately 199,830 gallons per year. The Project would generate 52 daily trips. As shown above in **Table 4.6-2**, the County's annual diesel fuel use in 2027 is anticipated to be 535,939,687 gallons.[25] Estimated Project operational diesel fuel use would represent 0.0002 percent of the County's current diesel use. Thus, the proposed Project would not result in a substantial demand for energy that would require expanded supplies or the construction of other infrastructure or expansion of existing facilities. The 14 emergency generators are estimated to utilize approximately 198,912 gallons per year of diesel due to testing and maintenance. Estimated Project operational gasoline fuel use would be approximately 10,172 gallons per year, which represent 0.0003 percent of the County's current gasoline use. Thus, the proposed Project would not result in a substantial demand for energy that would require expanded supplies or the construction of other infrastructure or expansion of existing facilities. Therefore, Project operations would not result in wasteful, inefficient, or unnecessary fuel consumption. In addition, this analysis includes a conservative estimate of fuel usage.

None of the projected energy uses exceed one percent of the corresponding County use. Project operations would not substantially affect existing energy or fuel supplies or resources. Further, the Project would be subject to compliance with applicable energy standards and new capacity would not be required. Therefore, the Project would result in a less than significant impact concerning consumption of energy resources, and no mitigation is required.

4.6b Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less Than Significant Impact. Project design and operations would be subject to compliance with State Building Energy Efficiency Standards, appliance efficiency regulations, and CALGreen Code

[25] California Air Resources Board, EMFAC2017, 2018.

standards. As concluded in Response 4.6a, Project construction and operations would not result in wasteful, inefficient, or unnecessary consumption of energy resources. The Project would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency. Although the City has not adopted any specific plans that address energy efficiency, the City adopted the Climate Action Plan in 2012 to help the City comply with the City's GHG emissions reduction goals through implementation of many measures that also result in energy conservation and efficiency. In addition, the Project would receive its electricity from SCE, which satisfies its renewable energy portfolio standards and includes approximate 33.2 percent of its energy mix from renewable energy sources. The Project would not otherwise conflict with or obstruct compliance with plans for renewable energy. As such, the Project would be designed to meet all applicable State building energy efficiency standards as well as the City's energy efficiency standards. Therefore, the Project would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency. Impacts would be less than significant, and no mitigation would be required.

4.7 Geology and Soils

This Section is based on the *Geotechnical Investigation* (June 2024, Leighton Consulting, Inc.) and *Cultural Resources Assessment* (BCR Consulting, LLC, July 2024), which are included in **Appendix F: Geotechnical Investigation and Appendix D: Cultural Resources Assessment**, respectively.

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.			X	
ii) Strong seismic ground shaking?			X	
iii) Seismic-related ground failure, including liquefaction?				X
iv) Landslides?				X
b) Result in substantial soil erosion or the loss of topsoil?			X	
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?			X	
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?			X	
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?				X
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?		X		

Impact Analysis

4.7a.i Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, or death involving the rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Less Than Significant Impact. The Alquist-Priolo Earthquake Fault Zoning Act was passed in 1972 to mitigate the hazard of surface faulting to structures for human occupancy. The Act's main purpose is to prevent the construction of buildings used for human occupancy on the surface trace of active faults. The Act requires the State Geologist to establish regulatory zones, known as Alquist Priolo (AP) Earthquake Fault Zones, around the surface traces of active faults and to issue appropriate maps. If an active fault is found, a structure for human occupancy cannot be placed over the trace of the fault and must be set back from the fault (typically 50 feet). According to the Geotechnical Investigation prepared for this Project, there are no identified Alquist-Priolo Earthquake Fault Zones that traverse the Project Site.[26] Therefore, the potential for surface fault rupture at the Project Site is considered low, and the Project would not cause potential substantial adverse effects involving rupture of a known earthquake fault. Nonetheless, the design of the proposed structures on-site would be designed to accommodate seismic loading, pursuant to the most recent California Building Code (CBC), City Building Code, and engineering design recommendations in the Geotechnical Investigation. The City's Building and Safety Division is responsible for implementing the provisions of the applicable building codes. The Project would be required to comply with plan review and permitting requirements of the City before the start of construction, as well as comply with the recommendations provided in a final design, and site-specific, geotechnical report that is subject to review and approval by the City. Therefore, the Project would not result in substantial damage to structures or infrastructure or expose people to substantial risk of injury involving the rupture of a known earthquake fault, and impacts from fault rupture would be less than significant.

4.7a.ii Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, or death involving strong seismic ground shaking?

Less Than Significant Impact. The Project Site is within the Southern California region, a seismically active area, with several active and potentially active faults mapped within 10 kilometers of the Project Site, and thus is exposed to potential risk involving strong seismic ground shaking. Accordingly, the Project would be subject to compliance with the most recent CBC and City Building Code, which are intended to minimize potential risk involving seismic ground shaking. The Project would also be required to adhere to engineering design recommendations presented in the Geotechnical Investigation. The City would verify compliance with the Geotechnical Investigation recommendations through the Project's Building Permit review process. Therefore, following compliance with the established regulatory framework and recommendations provided by the Geotechnical Investigation, the Project would not cause

[26] Leighton Consultants, Inc. Geotechnical Investigation, 2024.

potential substantial adverse effects involving strong seismic ground shaking, and impacts would be less than significant.

4.7a.iii Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, or death involving seismic-related ground failure, including liquefaction?

No Impact. Liquefaction is a seismic phenomenon in which loose, saturated, relatively uniform fine- to medium-grained clean cohesionless soils behave similarly to a fluid when subjected to high-intensity and long-duration ground shaking. Three criteria must be met for liquefaction to occur: 1) loose, clean granular soils, 2) shallow groundwater, and 3) strong, long-duration ground shaking.

According to the Geotechnical Investigation, the Project Site is underlain by relatively medium dense to dense engineered artificial fill overlying hard bedrock. Additionally, the Geotechnical Investigation's review of the California Geological Survey's Earthquake Zones of Required Investigation for the El Monte Quadrangle Map indicates that the Project Site is not within an area potentially susceptible to liquefaction. Furthermore, groundwater was not encountered in the exploratory borings conducted for the Project Site to the maximum depth explored of 36.5 feet below ground surface (bgs). Therefore, due to the presence of engineered fill, deep groundwater levels, and shallow bedrock within the Project Site, the Project would not cause potential adverse effects involving seismic-related ground failure, including liquefaction. No impact would occur in this regard.

4.7a.iv Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, or death involving landslides?

No Impact. Landslides are mass movements of the ground that include rock falls, relatively shallow slumping and sliding of soil, and deeper rotational or transitional movement of soil or rock. According to the Geotechnical Investigation, the Project Site is not located in an area mapped as potentially susceptible to seismically-induced landslides. No landslides are mapped or known to exist at the Project Site or vicinity. The slopes to the northwest of the Project Site below the La Loma reservoir water tanks are reported as buttressed with engineered fill. Therefore, the potential for seismically-induced landslides to impact the Project Site is very low, and the Project would not cause adverse effects involving landslides. No impact would occur in this regard.

4.7b Would the project result in substantial soil erosion or the loss of topsoil?

Less Than Significant Impact. The Project Site is located on relatively level ground (with the exception of the moderate slopes on the northern end of the Project Site), which would reduce the likelihood of soil erosion. However, earthmoving activities associated with proposed demolition and construction activities have the potential to result in soil erosion or the loss of topsoil. Development of the Project would be subject to local and State regulations for erosion control and grading during construction. For example, the Project would be required to comply with the Construction General Permit (CGP) issued by the State Water Resources Control Board (SWRCB), effective September 1st, 2023, which regulates construction activities to minimize

water pollution, including sediment risk from construction activities to receiving waters. Project development would be subject to the National Pollution Discharge Elimination System (NPDES) program, including the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP), which is further discussed in **Section 4.10: Hydrology and Water Quality**. The Project's construction contractor would be required to prepare and implement a SWPPP and associated best management practices (BMPs) in compliance with the CGP during grading and construction activities. Typical construction BMPs include, but are not limited to, watering soil, soil cover of inactive areas, gravel bags, and fiber rolls.

Additionally, after Project completion, the Project Site would be developed with a new data center building, ancillary equipment yard, substation, parking, and associated hardscape and landscape improvements. All landscaped areas would be required to comply with the provisions of MPMC Chapter 6.31, Water Efficient Landscapes. The Project would also implement operational BMPs and Low Impact Development (LID) standards in compliance with the MPMC Chapter 6.30, Stormwater and Urban Runoff Pollution Prevention Controls, which requires stormwater and urban runoff pollution prevention controls; see **Section 4.10: Hydrology and Water Quality** for more information on operational BMPs. Implementation of the BMPs and LID standards would help ensure that soil erosion would not occur during the Project's operation phase. BMP implementation would be ensured through the City's building plan check and development review process.

For the reasons listed above, soil erosion impacts from the Project's construction and operation phases would be less than significant.

4.7c Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Less Than Significant Impact. The Project Site would not be subject to seismically-induced liquefaction (see Response 4.7a.iii) or landslides (see Response 4.7a.iv).

For lateral spreading to occur, the liquefiable zone must be continuous, unconstrained laterally, and free to move along gently sloping ground toward an unconfined area. Since liquefaction is not considered a hazard at the Project Site (see Response 4.7a.iii), earthquake-induced lateral spreading is also not considered a hazard at the Project site. Therefore, there would be no impacts associated with lateral spreading.

Ground surface subsidence generally results from the extraction of fluids or gas from the subsurface, which can result in a gradual lowering of the ground level. The Project Site is not mapped in an area of subsidence by the U.S. Geological Survey.[27] Furthermore, due to the absence of groundwater during exploration, the Project would not involve any dewatering activities that could cause ground subsidence on the Project Site. Additionally, according to the Geotechnical Investigation, minor ground subsidence is expected due to earthquake-induced settlement which is estimated to be less than one inch, with differential seismic settlements of

[27] United States Geological Survey, Areas of Land Subsidence in California, https://ca.water.usgs.gov/land_subsidence/california-subsidence-areas.html. Accessed March 19, 2024.

0.5 inch over a distance of 30 feet. Therefore, the potential for ground collapse and other adverse effects due to subsidence to occur on the Project site is considered low, and impacts associated with subsidence would be less than significant.

Regarding collapsible soils, the results of the testing of soil samples conducted for the Geotechnical Investigation indicated that on-site soils are not susceptible to collapse when wetted. Therefore, the Project's potential for collapse is considered low, and impacts associated with collapse would be less than significant.

For the reasons substantiated above, Project development would not cause substantial hazards arising from unstable soils. Impacts would be less than significant.

4.7d Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risk to life or property?

Less Than Significant Impact. According to the Geotechnical Investigation, a combined evaluation of test results from past on-site geotechnical surveys and this current Geotechnical Investigation for this Project indicate that the soils within the Project Site have range from medium expansion to very low results. Therefore, the Project Site's expansion potential is considered to be low. The Project would be designed and constructed in accordance with relevant federal, State, and City regulations. Additionally, the Geotechnical Investigation includes engineering design recommendations to onsite soils, less any deleterious material or organic matter, as required fills. Any required import material should consist of relatively non-expansive soils with a very low to low expansion index. The City would verify compliance with the Geotechnical Investigation recommendations through the Project's Building Permit process. Therefore, following compliance with pertinent regulations and Geotechnical Investigation recommendations, the Project would not create substantial risk involving expansive soils, and impacts would be less than significant.

4.7e Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

No Impact. The Project would construct sewer laterals that would connect to existing sewer lines in surrounding roadways. The Project does not propose to use septic tanks or alternative wastewater disposal systems. Temporary sanitary systems would be brought in during construction and removed when the Project becomes operational. Therefore, no impact would occur in this regard.

4.7f Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less Than Significant Impact with Mitigation Incorporated. Paleontological resources are the fossilized remains of organisms from prehistoric environments found in geologic strata. These resources are valued for the information they yield about the earth's history and its past ecological settings. The potential for fossil occurrence depends on the rock type exposed at the surface in a given area. According to the Geotechnical Investigation, the Project Site is underlain

by artificial fill ranging in thickness from 2 to over 15 feet. According to the paleontology collection records search conducted within the El Monte Quadrangle with the Natural History Museum of Los Angeles County for the CRA, there are no fossil localities that lie directly within the Project Site. However, fossil localities nearby from the same sedimentary deposits may occur in the Project area, either at or beneath the surface. Therefore, Project impacts to paleontological resources may be potentially significant during ground-disturbing activities. To address such impacts, the Project would be subject to compliance with **MM GEO-1**, which requires a qualified paleontological monitor to be on-site during Project ground-disturbing activities. Therefore, following compliance with **MM GEO-1**, the Project's potential impacts to paleontological resources would be reduced to a less than significant level.

Mitigation Measures

MM GEO-1 If construction personnel encounter paleontological resources during ground-disturbing activities, they must inform the site construction superintendent who will notify the City and Project Applicant. The Project Applicant must then contact a qualified paleontologist as defined by the Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources by the SVP (SVP, 2010) and all ground-disturbing activity must cease in the immediate area of the find (within a 50-foot buffer) until the paleontologist can evaluate the find.

If the discoveries are determined to be significant, full-time paleontological monitoring will be recommended for the remainder of ground disturbance for the project. Paleontological monitoring must entail the visual inspection of excavated or graded areas and trench sidewalls. If a paleontological resource is discovered, the monitor will have the authority to temporarily divert the construction equipment around the find until it is assessed for scientific significance and collected. Monitoring efforts can be reduced or eliminated at the discretion of the project paleontologist.

Upon completion of fieldwork, all significant fossils collected will be prepared in a properly equipped paleontology laboratory to a point ready for curation. Preparation will include the careful removal of excess matrix from fossil materials and stabilizing and repairing specimens, as necessary. Following laboratory work, all fossil specimens must be identified to the most specific taxonomic level possible, cataloged, analyzed, and delivered the Natural History Museum of Los Angeles County for permanent curation and storage. The cost of curation is assessed by the repository and is the responsibility of the Project Applicant. At the conclusion of laboratory work and museum curation, a final Paleontological Monitoring Report will be prepared describing the results of the paleontological mitigation monitoring efforts associated with the Project. The report must include a summary of the field and laboratory methods, an overview of the Project area geology and paleontology, a list of taxa recovered, an analysis of fossils recovered

and their scientific significance, and recommendations. A copy of the report must be submitted to the Natural History Museum of Los Angeles County.

4.8 Greenhouse Gas Emissions

This Section is based on the *Greenhouse Gas Emissions Analysis Memorandum* (Kimley-Horn, August 2024), which is included in **Appendix A-2: Offsite Improvements for Southern California Service** and **Appendix G: Greenhouse Gas Emissions Analysis Memorandum**.

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?			X	
b) Conflict with applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?			X	

Regulatory Setting

Federal

To date, national standards have not been established for nationwide GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

U.S. Environmental Protection Agency Endangerment Finding

The U.S. EPA authority to regulate GHG emissions stems from the U.S. Supreme Court decision in *Massachusetts v. EPA* (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases

could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the U.S. EPA finalized an endangerment finding in December 2009. Based on scientific evidence it found that six GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) constitute a threat to public health and welfare. Thus, it is the Supreme Court's interpretation of the existing FCAA and the U.S. EPA's assessment of the scientific evidence that form the basis for the U.S. EPA's regulatory actions.

Federal Vehicle Standards

In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the U.S. EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the U.S. EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, U.S. EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the U.S. EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency.

On April 2, 2018, the Administrator signed the Mid-term Evaluation Final Determination which finds that the model year 2022-2025 GHG standards are not appropriate in light of the record before U.S. EPA and, therefore, should be revised.[28]

On September 19, 2019, under the Safer, Affordable, Fuel-Efficient (SAFE) Vehicles Rule, the U.S. Department of Transportation's National Highway Traffic Safety Administration (NHSTA) and the U.S. EPA issued the final "One National Program Rule." The rule states that federal law preempts state and local laws regarding tailpipe GHG emissions standards, zero emissions vehicle (ZEV) mandates, and fuel economy for automobiles and light duty trucks. The rule revokes California's Clean Air Act waiver and preempts California's Advanced Clean Car Regulations.[29,30]

On September 20, 2019, a lawsuit was filed by California and a coalition of 22 other states, and the cities of Los Angeles, New York and Washington, D.C., in the United States District Court for the District of Columbia (Case 1:19-cv-02826) challenging the SAFE Rule and arguing that U.S. EPA lacks the legal authority to withdraw the California waiver. In April 2021, the U.S. EPA announced

[28] U.S. Environmental Protection Agency. Midterm Evaluation of Light-Duty Vehicle Greenhouse Gas Emissions Standards for Model Years 2022-2025, https://www.epa.gov/regulations-emissions-vehicles-and-engines/midterm-evaluation-light-duty-vehicle-greenhouse-gas. Accessed April 12, 2024.

[29] U.S. Department of Transportation and U.S. EPA. 2019. One National Program Rule on Federal Preemption of State Fuel Economy Standards, https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P100XI4W.pdf. Accessed May 7, 2024.

[30] Southern California Association of Governments. 2019. Final Federal Safer, Affordable, Fuel-Efficient Vehicles Rule Part I (Supplemental Report), http://www.scag.ca.gov/committees/CommitteeDocLibrary/EEC_Item8_RC_Item10%20Supplemental%20Report.pdf. Accessed May 7, 2024.

it would reconsider its previous withdrawal and grant California permission to set more stringent climate requirements for cars and SUVs. On March 9, 2022, the U.S. EPA restored California's 2013 waiver to full force, including both its GHG standards and ZEV sales requirements.

In December 2021, the U.S. EPA finalized federal GHG emissions standards for passenger cars and light trucks for Model Years 2023 through 2026. These standards are the strongest vehicle emissions standards ever established for the light-duty vehicle sector and are based on sound science and grounded in a rigorous assessment of current and future technologies. The updated standards will result in avoiding more than three billion tons of GHG emissions through 2050.[31]

Presidential Executive Orders 13990 and 14008

On January 20, 2021, President Biden issued Executive Order 13990, "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis". Executive Order 13990 directs Federal agencies to immediately review and take action to address the promulgation of Federal regulations and other actions that conflict with these important national objectives and to immediately commence work to confront the climate crisis. Executive Order 13990 directs the Council on Environmental Quality (CEQ) to review CEQ's 2020 regulations implementing the procedural requirements of the National Environmental Policy Act (NEPA) and identify necessary changes or actions to meet the objectives of Executive Order 13990.

Executive Order 13390 also directs the U.S. EPA to consider whether to propose suspending, revising, or rescinding the standards previously revised under the "The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks," promulgated in April 2020.

On January 27, 2021, President Biden signed Executive Order 14008, "Tackling the Climate Crisis at Home and Abroad," to declare the Administration's policy to move quickly to build resilience, both at home and abroad, against the impacts of climate change that are already manifest and will continue to intensify according to current trajectories. In line with these Executive Order directives, CEQ is reviewing the 2020 NEPA regulations and plans to publish a notice of proposed rulemaking (NPRM) to identify necessary revisions in order to comply with the law; meet the environmental, climate change, and environmental justice objectives of Executive Orders 13990 and 14008; ensure full and fair public involvement in the NEPA process; provide regulatory certainty to stakeholders; and promote better decision making consistent with NEPA's statutory requirements. This phase 1 rulemaking will propose a narrow set of changes to the 2020 NEPA regulations to address these goals.

State

California Air Resources Board

CARB is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California's contribution

[31] U.S. EPA, Final Rule to Revise Existing National GHG Emissions Standards for Passenger Cars and Light Trucks Through Model Year 2026, 2021, https://www.epa.gov/regulations-emissions-vehicles-and-engines/final-rule-revise-existing-national-ghg-emissions. Accessed March 18, 2024.

to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of carbon dioxide equivalent (CO_2e) in the world and produced 369 million gross metric tons (MMT) of CO_2e in 2020.[32] The transportation sector is the State's largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark AB 32 California Global Warming Solutions Act of 2006, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance energy standards, were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major legislation related to GHG emissions reduction.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

AB 32 instructs the CARB to develop and enforce regulations for the reporting and verification of statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020, which would require a reduction of approximately 173 MMT net CO_2e below "business as usual" emission levels. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

Climate Change Scoping Plan

The Scoping Plan is a GHG emission reduction roadmap developed and updated by the CARB at least once every five years, as required by AB 32. It lays out the transformations needed across various sectors to reduce GHG emissions and reach the State's climate targets. CARB published the Final 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan Update) in November 2022, as the third update to the initial plan that was adopted in 2008. The initial 2008 Scoping Plan laid out a path to achieve the AB 32 target of returning to 1990 levels of GHG emissions by 2020, a reduction of approximately 15 percent below business as usual activities.[33] The 2008 Scoping Plan included a mix of incentives, regulations, and carbon pricing, laying out the portfolio approach to addressing climate change and clearly making the case for using multiple tools to meet California's GHG targets. The 2013 Scoping Plan Update (adopted in 2014) assessed progress toward achieving the 2020 target and made the case for addressing short-lived climate pollutants (SLCPs).[34] The 2017 Scoping Plan Update,[35] shifted focus to the newer Senate Bill (SB) 32 goal of a 40 percent reduction below 1990 levels by 2030 by laying out a detailed cost-effective and technologically feasible path to this target, and also assessed progress towards

[32] California Air Resources Board, Current California GHG Emissions Inventory Data, 2000-2020 GHG inventory (2022 Edition), https://ww2.arb.ca.gov/ghg-inventory-data. Accessed March 18, 2024.

[34] CARB, First Update to the Climate Change Scoping Plan, 2014, ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf. Accessed April 22, 2024.
[35] CARB, California's 2017 Climate Change Scoping Plan, 2017, ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/scoping_plan_2017.pdf. Accessed April 22, 2024.

achieving the AB 32 goal of returning to 1990 GHG levels by 2020. The 2020 goal was ultimately reached in 2016, four years ahead of the schedule called for under AB 32.

The 2022 Scoping Plan Update is the most comprehensive and far-reaching Scoping Plan developed to date. It identifies a technologically feasible, cost-effective, and equity-focused path to achieve new targets for carbon neutrality by 2045 and to reduce anthropogenic GHG emissions to at least 85 percent below 1990 levels, while also assessing the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan. According to the Scoping Plan Update, the 2030 target is an interim but important stepping stone along the critical path to the broader goal of deep decarbonization by 2045. The relatively longer path assessed in the 2022 Scoping Plan Update incorporates, coordinates, and leverages many existing and ongoing efforts to reduce GHGs and air pollution, while identifying new clean technologies and energy. Given the focus on carbon neutrality, the 2022 Scoping Plan Update also includes discussion for the first time of the natural and working lands sectors as sources for both sequestration and carbon storage, and as sources of emissions as a result of wildfires.

The 2022 Scoping Plan Update reflects existing and recent direction in the Governor's Executive Orders and State Statutes, which identify policies, strategies, and regulations in support of and implementation of the Scoping Plan. Among these include Executive Order B-55-18 and AB 1279 (The California Climate Crisis Act), which identify the 2045 carbon neutrality and GHG reduction targets required for the Scoping Plan. A summary of major climate legislation and executive orders issued since the adoption of the 2017 Scoping Plan is provided in Table 2 of **Appendix G** of this IS/MND.

The 2022 Scoping Plan Update scenario identifies the need to accelerate AB 32's 2030 target, from 40 percent to 48 percent below 1990 levels. Cap-and-Trade regulation continues to play a large factor in the reduction of near-term emissions for meeting the 2030 reduction target. Every sector of the economy will need to begin to transition in this decade to meet these GHG reduction goals and achieve carbon neutrality no later than 2045. The 2022 Scoping Plan Update approaches decarbonization from two perspectives, managing a phasedown of existing energy sources and technologies, as well as increasing, developing, and deploying alternative clean energy sources and technology. The Scoping Plan Scenario is summarized in Table 2-1 starting on page 72 of the Scoping Plan. It includes references to relevant statutes and Executive Orders, although it is not comprehensive of all existing new authorities for directing or supporting the actions described. Table 2-1 identifies actions related to a variety of sectors such as: smart growth and reductions in Vehicle Miles Traveled (VMT); light-duty vehicles (LDV) and zero-emission vehicles (ZEV); truck ZEVs; reduce fossil energy, emissions, and GHGs for aviation ocean-going vessels, port operations, freight and passenger rail, oil and gas extraction; and petroleum refining; improvements in electricity generation; electrical appliances in new and existing residential and commercial buildings; electrification and emission reductions across industries such as the for food products, construction equipment, chemicals and allied products, pulp and paper, stone/clay/glass/cement, other industrial manufacturing, and agriculture; retiring of

combined heat and power facilities; low carbon fuels for transportation, business, and industry; improvements in non-combustion methane emissions, and introduction of low GWP refrigerants.

Achieving the targets described in the 2022 Scoping Plan Update will require continued commitment to and successful implementation of existing policies and programs, and identification of new policy tools and technical solutions to go further, faster. California's Legislature and state agencies will continue to collaborate to achieve the state's climate, clean air, equity, and broader economic and environmental protection goals. It will be necessary to maintain and strengthen this collaborative effort, and to draw upon the assistance of the federal government, regional and local governments, tribes, communities, academic institutions, and the private sector to achieve the state's near-term and longer-term emission reduction goals and a more equitable future for all Californians. The Scoping Plan acknowledges that the path forward is not dependent on one agency, one state, or even one country. However, the State can lead by engaging Californians and demonstrating how actions at the state, regional, and local levels of governments, as well as action at community and individual levels, can contribute to addressing the challenge.

Aligning local jurisdiction action with state-level priorities to tackle climate change and the outcomes called for in the 2022 Scoping Plan Update is identified as critical to achieving the statutory targets for 2030 and 2045. The 2022 Scoping Plan Update discusses the role of local governments in meeting the State's GHG reductions goals. Local governments have the primary authority to plan, zone, approve, and permit how and where land is developed to accommodate population growth, economic growth, and the changing needs of their jurisdictions. They also make critical decisions on how and when to deploy transportation infrastructure, and can choose to support transit, walking, bicycling, and neighborhoods that do not force people into cars. Local governments also have the option to adopt building ordinances that exceed statewide building code requirements and play a critical role in facilitating the rollout of ZEV infrastructure. As a result, local government decisions play a critical role in supporting state-level measures to contain the growth of GHG emissions associated with the transportation system and the built environment—the two largest GHG emissions sectors over which local governments have authority. The City has taken the initiative in combating climate change by developing programs and regulations such as the Green New Deal and Green Building Code.

California Regulations and Building Codes

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

Title 20 Appliance Efficiency Regulations. The appliance efficiency regulations (CCR Title 20, Sections 1601-1608) include standards for new appliances. Twenty-three categories of appliances are included in the scope of these regulations. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

Title 24 Building Energy Efficiency Standards. California's Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6) was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The 2016 Building Energy Efficiency Standards approved on January 19, 2016, went into effect on January 1, 2017. The 2019 Building Energy Efficiency Standards were adopted on May 9, 2018, and went into effect on January 1, 2020. Under the 2019 standards, homes will use about 53 percent less energy and nonresidential buildings will use about 30 percent less energy than buildings under the 2016 standards.

On August 11, 2021, the CEC adopted the 2022 Building Energy Efficiency Standards (2022 Energy Code). In December, it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Energy Code encourages efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, strengthens ventilation standards, and more. Buildings whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.

Title 24 California Green Building Standards Code. The California Green Building Standards Code (CCR Title 24, Part 11 code) commonly referred to as the CALGreen Code, is a statewide mandatory construction code developed and adopted by the California Building Standards Commission and the Department of Housing and Community Development. The CALGreen standards require new residential and commercial buildings to comply with mandatory measures under the topics of planning and design, energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt that encourage or require additional measures in the five green building topics. The most recent update to the CALGreen Code went into effect January 1, 2023 (2022 CALGreen). The 2022 CALGreen standards continue to improve upon the existing standards for new construction of, and additions and alterations to, residential and nonresidential buildings.

Regional

South Coast Air Quality Management District Thresholds

The SCAQMD is the air pollution control agency for Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino Counties. The agency's primary responsibility is ensuring that CAAQS and NAAQS are attained and maintained in the SoCAB. The SCAQMD is also responsible for adopting and enforcing rules and regulations concerning air pollutant sources, issuing permits for stationary sources of air pollutants, inspecting stationary sources of air pollutants, responding to citizen complaints, monitoring ambient air quality and meteorological conditions, awarding grants to reduce motor vehicle emissions, conducting public education campaigns, and many other activities. All projects are subject to applicable SCAQMD rules and

regulations in effect at the time of construction and operation. The following is the SCAQMD rule relevant to GHG:

- **Rule 1415 (Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems)** – The purpose of this rule is to reduce emissions of high-global warming potential refrigerants from stationary air conditioning systems by requiring projects to reclaim, recover, or recycle refrigerant and minimize leakage.

Southern California Association of Governments

On September 3, 2020, SCAG's Regional Council adopted the 2020-2045 RTP/SCS. The RTP/SCS charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The strategy was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The RTP/SCS is a long-range vision plan that balances future mobility and housing needs with economic, environmental, and public health goals. The SCAG region strives toward sustainability through integrated land use and transportation planning. The SCAG region must achieve specific federal air quality standards and is required by state law to lower regional GHG emissions.

Local

City of Monterey Park General Plan

The City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City's General Plan includes a Sustainable Community Element, adopted in 2014, that contains the following policies specific to greenhouse gas emissions applicable to the Project:

Sustainability Community Element

Goal 9: Greenhouse gas emissions from energy production are minimized through reduced energy demand and expanded use of renewable energy sources.

Policy 9.1 Increased Energy Efficiency: Ensure high energy efficiency for all buildings through demonstration, education, and incentives.

Policy 9.3 Solar-Ready Roofs: For new construction and renovations, encourage builders to provide roofs that are solar panel-ready particularly commercial roofs.

City of Monterey Park Climate Action Plan ("CAP")

The City's qualified CAP, approved in 2012, provides the City's road map to reducing community GHG emissions associated with existing and future actions and activities. The CAP was adopted by the City Council on October 3, 2012. The CAP included baseline emissions inventory and projection of future emissions; establishing a community-wide reduction target for 2020 and

2035; identify strategies, actions, and measures to meet reduction targets; evaluate CEQA impacts of the proposed strategies; and monitor effectiveness of reduction measures and the CAP to changing conditions. The CAP establishes a policy to reduce the City's GHG emissions by 15 percent below baseline 2009 levels by 2020, and sets an aspirational goal of achieving GHG emissions 49 percent below baseline 2009 levels by 2035. The CAP does not include quantitative project-level CEQA thresholds or percentage reduction targets for individual projects.

The CAP includes numerous GHG reduction measures, split into five categories: Energy, Land Use, Transportation, Water, and State and Federal. The State and Federal measures would account for 67.9 percent reduction in GHG emissions. The remaining four categories are considered City measures. The complete list of GHG reduction measures is shared in Threshold (b) below. Generally, the purpose of the CAP is to establish measures capable of reducing GHG and promoting economic growth based on clean technology and sustainable practices.

Methodology

The Project's construction and operational emissions were calculated using CalEEMod. Details of the modeling assumptions and emission factors are provided in **Appendix G**. For construction, CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. GHG emissions during construction were forecasted based on the proposed construction schedule and applying the mobile-source and fugitive dust emissions factors derived from CalEEMod. The Project's construction-related GHG emissions would be generated from off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. The Project's operational-related GHG emissions would be generated by vehicular traffic, area sources (e.g., landscaping maintenance and consumer products), electrical generation demand, natural gas consumption, water supply and wastewater treatment, solid waste, water usage, and energy usage.

Impact Analysis

4.8a Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

4.8b Would the project conflict with applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Consistency with Applicable Plans and Policies

The Project would replace an older building that occupies the site currently and would be subject to compliance with all building codes in effect at the time of construction, which would include energy conservation measures mandated by Title 24 of the California Building Standards Code – Energy Efficiency Standards. Because Title 24 standards require energy conservation features in new construction (e.g., high- efficiency lighting, high-efficiency heating, ventilating, and air-conditioning ("HVAC") systems, thermal insulation, double-glazed windows, water conserving plumbing fixtures), they indirectly regulate and reduce GHG emissions. California's Building Energy Efficiency Standards are updated on an approximately three-year cycle. The most recent 2019 standards went into effect January 1, 2020. The 2022 Energy Code and associated Title 24 standards went into effect January 1, 2023.

Consistency with the City of Monterey Park Climate Action Plan

In 2012, the City adopted the CAP which sets forth a comprehensive strategy to address GHG emissions related to land use patterns, transportation, building design, energy use, water demand, and waste generation. The Project's consistency with the CAP is analyzed in **Table 4.8-1: City of Monterey Park Climate Action Plan Measures Consistency**.

Table 4.8-1: City of Monterey Park Climate Action Plan Consistency

Measure	Description	Consistency
Building Efficiency		
E1. Efficiency Requirements for New Developments	The City, in coordination with the California Building Standards Commission and the California Energy Commission, will adopt energy efficiency regulations for new construction projects that comply with the 2008 California Green Building Code Tier 1 energy efficiency standards. The Tier 1 energy efficiency standards require a building's energy performance to exceed Title 24 standards by 15 percent for both residential and nonresidential development.	**Consistent**: The proposed Project would comply with California Green Building Standards Code (CCR Title 24, Part 11 Code) (CALGreen) which requires new residential and nonresidential buildings to comply with mandatory measures including energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. The Project would be required to comply with the provisions of the CALGreen standards. In addition, the Project would have three EV charging spaces.
E2. Building Retrofits	31 percent of total GHG emissions in the City are a result of energy used for commercial and residential buildings. Since the vast majority of buildings in the City were built before 2002, there is tremendous potential to increase the overall energy efficiency of buildings in the City with a range of energy efficiency upgrades.	**N/A**: This is not applicable to the Project. The Project would demolish and remove the existing improvements and construct a new data center. As building standards and efficiency has improved since the construction of the original building the replacement structure would be more energy efficient.
E3. Appliance Upgrade	The City will partner with SCE, the SoCal Gas, and the Metropolitan Water District to provide to increase awareness about rebate and incentive programs, the efficiencies that	**Consistent:** The Project would utilize energy efficient appliances and comply with the latest Title 24 energy efficiency requirements. In addition, the Project would not include natural gas.

Table 4.8-1: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
	may be gained from Energy-Star-rated appliances, and the cost savings associated with Energy Star appliances.	
E4. Smart Meters	Emerging energy management systems or Smart Meters are currently being stalled by SCE as a means to improve how electricity consumption is managed. These Smart Meters will eventually provide utility customers with access to detailed and instantaneous energy use and cost information, new pricing programs based on peak-energy demand, and the ability to program home appliances and devices to respond to cost, comfort, and convenience.	**Consistent:** The Project's utility provider (SCE) would install smart meters upon development.
Increase Renewable Energy Generation		
R1. Solar Water Heating	Solar hot water systems are a simple, reliable, and cost-effective method for harnessing the sun's energy to provide hot water. Solar collectors, usually placed on the roof, absorb the sun's energy to heat water that is stored in a water tank. Although solar water heater upgrades require an up-front investment from the resident or business owner, there is a range of financing and rebate options available to offset these initial costs.	**N/A:** The Project plumbing is not designed to include a hot water system that requires water to be stored in a water tank. Thus, this measure is not applicable. In any case, the Project would include rooftop design that is photovoltaic-system ready, which would allow solar energy to be distributed to project demand.
R2. Solar Photovoltaic Systems	Solar photovoltaic (PV) systems generate electrical power by converting solar radiation into direct-current	**Consistent:** The Project would construct new buildings on the site that could accommodate limited solar photovoltaic systems on the roof to

Table 4.8-1: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
	electricity using semiconductors. PV systems can be retrofitted into existing buildings, usually by mounting them onto an existing roof structure or walls. The City will promote PV installations to provide 5 percent of residential electricity and 2 percent of commercial electricity energy use from solar PV generation by 2020.	offset overall energy demand. Due to rooftop mechanical equipment, and related screening elements to comply with code, the solar PV systems cannot not occupy the entire roof area. Approximately 45,000 square feet could accommodate future photovoltaic installation, which could result in a maximum output between 750 to 900 kilowatts of energy. Nonetheless, the Project would include rooftop building design that is compatible with a solar photovoltaic system on a portion of the roofed areas. Nonetheless, the Project would include rooftop building design that is compatible with a solar photovoltaic system on a portion of the roofed areas.
Land Use		
LU1. Mixed Use Development	Increasing the availability, effectiveness, and use of transit could result in a 0.5 percent reduction in overall vehicle miles travelled (VMT) in the City by 2020. To meet the VMT reduction target, the City will create additional incentives to build and actively facilitate new mixed-use development near existing and planned transit corridors.	**N/A:** This is a municipal measure and not Project specific. This measure is intended to encourage and incentivize mixed-use development, which is not applicable to the Project. It should be noted that the land use policies in the CAP encourage infill and redevelopment, which is relevant to, and consistent with, the Project as it redevelops and existing infill site instead of developing undeveloped land.
LU2. Service Nodes	Through changes proposed under the new Zoning Ordinance, the City will provide more opportunities for walking, biking, and short-distance vehicular trips by promoting service nodes, which are employment centers with eating establishments, coffee shops,	**N/A:** This is a municipal measure and not Project specific. Therefore, this measure is not applicable. It should be noted that the land use policies in the CAP encourage infill and redevelopment, which is relevant to, and consistent with, the Project as it redevelops and existing infill site instead of developing undeveloped land. It should also be noted that the

Table 4.8-1: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
	day care, dry cleaners, and other services in proximity.	site is in a voter-enacted zone, thus the City amendments to the zoning ordinance are inapplicable here unless voter-enacted.
Transportation		
T1.1 Increase Transit Use: Lower Cost of Riding Transit	The City currently provides discounts to older adults on the purchase of transit passes, which are accepted locally and by regional transit providers. Pending funding availability, the City will expand the program to provide discounts to resident groups, such as students, or increase the subsidy in order to further promote transit use.	**Consistent:** This is a municipal measure and not specifically applicable to the Project. However, T1 encourages the City to expand transit programs to provide discounted transit passes to certain groups. These transit passes and programs would likely be available to employees of the Project who qualify for the City programs, and choose to ride transit to work, and hence the Project is consistent with implementation of this policy.
T1.2 Increase Transit Use: Promote Use of Transit Network	Promoting the availability of local and regional transit options is necessary to increase awareness and ridership. Therefore, the City will develop marketing or outreach programs to promote the use of the Spirit Bus and other transit options. The potential for VMT reduction with implementation of this action is 1% by 2020.	**N/A:** This is a municipal measure and not specifically applicable to the Project. Therefore, this measure is not applicable. It should be noted that the Project is a low VMT generator and would be compatible with any program the City develops to increase awareness of regional transit options, which the employees of the Project may use.
T2.1 Increase Walking and Biking: Expand Pedestrian Network and Increase Bicycle Parking.	The City will focus on implementation of traffic-calming projects and other necessary pedestrian amenities and safety improvements to enable walking as an attractive travel mode. The City will also identify opportunities to install bicycle parking in public areas and work with local employers	**Consistent**: This is a municipal measure and not specifically applicable to the Project. However, the Project is consistent with this policy because it does improve the pedestrian realm by improving the frontages surrounding the Project Site.

Table 4.8-1: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
	to facilitate the expansion or provision of end-of-trip facilities.	
T2.2 Increase Walking and Biking Provide End-Of-Trip Facilities	The City will work with local employers to facilitate the expansion or provision of these facilities. As part of the outreach, the City will spotlight the facilities offered to its own employees, which includes bike racks at City Hall, and changing rooms, lockers, and showers for most employees. Research has shown that VMT can be reduced by 2% to 5% through end-of-trip facilities. With 50% of the travel within the City associated with commuting, this action can achieve 1% VMT reduction by 2020.	**N/A:** This is a municipal measure and not specifically applicable to the Project. Therefore, this measure is not applicable.
T3. Transportation Demand Management (TDM)	Transportation demand management (TDM) is a series of strategies that aim to reduce single-occupancy automobile trips. These strategies frequently target commute trips associated with employment within a community. Under this program, private companies with less than 250 employees would be encouraged, but not required, to implement a TDM program for their employees. The City will designate a TDM Coordinator who will promote these programs at local businesses, show case the current municipal program as an example, and encourage additional TDM at existing and future businesses.	**Consistent**: This is a municipal measure and not specifically applicable to the Project. In addition, the Project would have far fewer than 250 employees and therefore is not required to implement a TDM program. Nonetheless, the Project would not obstruct the efforts of the City's TDM Coordinator to promote TDM programs for local business, and as such is consistent with implementation of this policy by the City.

Table 4.8-1: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
Water Conservation and Waste Reduction		
W1. Conserving Water	The City, in partnership with the San Gabriel Valley Water District, will continue to develop pilot or demonstration projects related to water conservation. The City will continue to work with the Water District to complete irrigation and revegetation of medians throughout the City with water-efficient irrigation equipment and native vegetation.	**Consistent:** The proposed Project would include landscaping on the site which would consist of native trees, shrubs, grasses, and groundcover, all of which would have very low or low water needs. The Project would include water efficient appliances per City and State codes. In addition, the Project is designed to include data center cooling technologies that minimize water use.
W2. Reducing Waste	This program allows the City to meet the 50 percent landfill diversion mandate required by State law while providing a service to residents and businesses. In addition to the Materials Recovery Facility (MRF) program, the City has additional waste diversion and recycling programs, ranging from backyard composting/ smart gardening workshops to participation in County-wide Household Hazardous Waste collection events.	**Consistent:** The proposed Project would be served by the local solid waste collection and recycling service that diverts waste consistent with City and State recycling and diversion targets.
Source: City of Monterey Park, 2012, City of Monterey Park Climate Action Plan, https://www.montereypark.ca.gov/DocumentCenter/View/581/Climate-Action-Plan?bidId=. Accessed April 22, 2024.		

As shown in **Table 4.8-1,** the proposed Project is consistent with the applicable policies within the City's CAP.

Consistency with the 2022 Scoping Plan

For the State of California, the 2022 Scoping Plan Update sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. The transportation, electricity, and industrial sectors are the largest GHG contributors in the State. The 2022 Scoping Plan Update plans to achieve the AB 1279 targets primarily through zero-emission transportation (e.g., electrifying cars, buses, trains, and

trucks). Additional GHG reductions are achieved through decarbonizing the electricity and industrial sectors.

Statewide strategies to reduce GHG emissions in the latest 2022 Scoping Plan Update include implementing SB 100, which would achieve 100 percent clean electricity by 2045; achieving 100 percent zero emission vehicle sales in 2035 through Advanced Clean Cars II; and implementing the Advanced Clean Fleets regulation to deploy zero-electric vehicle buses and trucks. The 2022 Scoping Plan Update would continue to implement SB 375. GHGs would be further reduced through the Cap-and-Trade Program carbon pricing and SB 905. SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate carbon dioxide removal projects and technology. The Project would be compliant with CALGreen, including required number of EV chargers.

The 2022 Scoping Plan Update states that local CAPs that address the State's largest sources of emissions and prioritize transportation electrification, VMT reduction, and building decarbonization, contribute to the alignment between local climate action and the State's climate goals. As indicated above, the proposed Project would be consistent with the City's CAP. Further, project's GHG emissions associated with energy and mobile sources would be further reduced by the 2022 Scoping Plan Update measures described above. It should be noted that the City has no control over vehicle emissions, however, these emissions would decline in the future due to Statewide measures discussed above, as well as cleaner technology and fleet turnover. In addition, the Project generates minimal VMT and daily traffic trips due to a limited number of employees required to work at and service the data center. Thus, the Project does not create substantial GHG emissions from vehicles in any case.

The Project would not impede the State's progress towards carbon neutrality by 2045 under the 2022 Scoping Plan. The Project would be required to comply with applicable current and future regulatory requirements promulgated through the 2022 Scoping Plan.

As noted above, the thresholds of significance for purposes of CEQA review are consistency with the lead agency's applicable plans regarding reduction of GHG emissions. Nevertheless, for contextual purposes, the Project would not conflict with implementation of the 2022 Scoping Plan.

In conclusion, the Project would not conflict with an applicable plan, policy, or regulation of the lead agency adopted for the purpose of reducing GHG emissions. Therefore, the proposed Project would not result in significant effects.

Quantification of Project Emissions

Short-Term Construction Greenhouse Gas Emissions

The Project would result in direct emissions of GHGs from construction. Construction of the Project would result in direct emissions of CO_2, N_2O, and CH_4 related to the operation of construction equipment, and the transport of materials and construction workers to and from the Project site. The SCAQMD advises that construction GHG emissions be summed and amortized over the lifetime of a project (assumed to be 30 years), then the yearly amount be

added to the operational emissions.[36] The annual GHG emissions generated by construction of the Project is shown in **Table 4.8-2: Construction Greenhouse Gas Emissions.**

Table 4.8-2: Construction Greenhouse Gas Emissions	
Year	**$MTCO_2e$ per year**
Construction (2025)	511
Construction (2026)	471
Construction (2027)	361
Total	1,343
Amortized Over 30 Years	44.77
Source: CalEEMod version 2022.1. Refer to **Appendix G** and **Appendix A-2** for model outputs.	

As shown, the Project would result in the generation of a maximum of 511 $MTCO_2e$ and a minimum of 361 $MTCO_2e$ per year during construction, with an amortized 44.77 $MTCO_2e$ annually. The total GHG construction emissions were amortized over the 30-year lifetime of the Project (i.e., total construction GHG emissions were divided by 30 to determine the annual construction emissions estimate that can be added to the Project's operational emissions) in order to determine the Project's annual GHG emissions inventory. Once construction is complete, the generation of these GHG emissions would cease. Neither the City nor SCAQMD have an adopted threshold of significance for construction related GHG emissions. Therefore, GHG emissions related to construction were quantified and disclosed in this report for informational purposes only.

Long-Term Operational Greenhouse Gas Emissions

Operational or long-term emissions would occur over the life of the proposed Project. GHG emissions would result from area sources (consumer products, landscape maintenance equipment, and painting), vehicular traffic, and diesel fuel associated with the emergency generators. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power, the energy required to convey water to, and wastewater from the Project, the emissions associated with solid waste generated from the Project, and any fugitive refrigerants from air conditioning or refrigerators.

The Project electricity usage would be mainly from the operation of the data center. The purpose of a data center is to house computer servers, which require electricity and cooling 24 hours a day to operate. Based on data in the **Appendix E**, Peak Power Demand Estimate Memorandum, the Project during peak load conditions would have a demand of 49,999 kilowatts per hour (KW/h). The analysis assumes 24/7 operations (8,760 hours per year) which would result in a maximum electrical usage of 437,991 megawatt hours (MWh) per year, including CalEEMod default assumptions for lighting for surface parking. The modeling also conservatively assumed

[36] The amortization period of 30-years is based on the standard assumption of the South Coast Air Quality Management District (South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #13,* August 26, 2009).

the 14 gen-sets would be used for up to 50 hours per year per generator for testing and maintenance. The generators would utilize diesel fuel.

Power Usage Effectiveness During Operation

Power usage effectiveness (PUE) is a metric to calculate the ratio of total facility power over IT equipment energy. Total facility power is the amount of power the facility uses which includes data center hardware, power delivery components, cooling and lighting systems. Whereas IT equipment includes energy related to the storage and networking equipment, and control equipment. The ideal PUE is one (1) where all power drawn by the facility goes to the IT infrastructure. The average PUE in 2019 was 1.67.[37] The proposed Project is anticipated to have a blended PUE of 1.2 due to free cooling modules on the air-cooled chillers, below the average for data centers. The proposed Project would be more efficient than the average data center.

Total GHG emissions associated with the Project are summarized in **Table 4.8-3: Operational Greenhouse Gas Emissions Opening Year**. The Project Site includes an office building that has been vacant since 2016. While the Project conservatively does not take credit for the historical emissions, there was a use on site in 2012 when the CAP was being prepared for the City. Therefore, net emissions would be less than shown in the table.

Table 4.8-3: Operational Greenhouse Gas Emissions Opening Year

Emissions Source	**MTCO$_2$e per Year[1]**
Amortized Construction Emissions	44.77
Area Source	5
Emergency Generators [2]	2,062
Mobile	80
Waste	70
Water and Wastewater	27
Refrigeration	0.1
Energy[3]	83,020
Total Emissions	85,309

1. Total values are from CalEEMod and may not add up due to rounding.
2. Emergency backup generator emissions calculated assuming 50 hours per year per generator (14 generators) for annual GHG analysis; regulatory compliance permitting requirements would limit daily criteria pollutant levels.
3. The servers in the data center were estimated to require approximately 50 MW of power per hour, and operations were conservatively estimated to be 8,760 hours per year. Total MW per year would be 437,991. Total CO_2e in tons per year would be 83,020. The Project does not include natural gas heaters or water heaters.

Source: CalEEMod version 2022.1. Refer to **Appendix G** and **Appendix A-2** for model outputs.

As shown above in **Table 4.8-3**, the emissions related to electricity use by the data center is a majority of the emissions. SCE is the utility providing electricity to the Project site. SCE's carbon

[37] Uptime Institute, Annual Data Center Survey Results, 2019, https://datacenter.com/wp-content/uploads/2019/06/data-center-survey-2019.pdf. Accessed May 7, 2024.

intensity factor in 2022 was 552 lbs CO_2e/MWh which includes 33.2 percent eligible renewable energy in the power mix.[38] Emissions associated with the Project's electricity consumption occur at power production facilities which are covered entities under the State's Cap-and-Trade regulations, which limit total GHG emissions by covered sources with decreasing allocations, and are subject to the RPS standard requiring the GHG intensity of electricity production to decrease steadily. These regulatory schemes serve as the foundation for the State's goal of net neutrality in 2045. Likewise, the implementation of these Statewide measures, including but not limited to SCE procuring and delivery electricity from renewable energy sources result in an annual reduction of GHG emissions associated with operation of the Project.

The Cap-and-Trade program covers approximately 80 percent of California's GHG emissions.[39] The statewide limit on GHG emissions from the capped sectors (i.e., electricity generation, industrial sources, petroleum refining, and cement production) will decline every year, achieving GHG emission reductions throughout the program's duration. The passage of AB 398 in July 2017 extended the duration of the Cap-and-Trade program from 2020 to 2030. The Cap-and-Trade program was extended in 2015 to cover combustion of fossil fuels including transportation fuels used in California. Accordingly, GHG emissions associated with the electricity usage and mobile sources of most projects that are subject to CEQA are covered by the Cap-and-Trade program.

Table 4.8-4: Trend of Project Greenhouse Gas Emissions Related to State Mandates shows the Project emissions in the opening year 2027, in 2035, consistent with the City's CAP horizon, and in 2045, the year the State will meet its carbon neutrality goal. **Table 4.8-4** also highlights the reduction in mobile emissions as passenger vehicle fleets become cleaner and technology improves. The trends show a steady decrease in Project GHG emissions, consistent with the overarching goals of the State's 2022 Scoping Plan and the City's CAP.

Table 4.8-4: Trend of Project Greenhouse Gas Emissions Related to State Mandates

	Annual Emissions ($MTCO_2e$ per Year)[1]		
Emissions Source	**2027 (Project Opening)**	**2035 (CAP Horizon)**	**2045 (CA GHG Neutrality)**
Mobile	80	71	67
Area	5	5	5
Energy[2]	83,020	62,657	0
Water	21	18	0
Waste	70	70	70
Generators	2,062	2,062	2,062
Total	85,258	64,883	2,204

1. Total values are from CalEEMod and may not add up due to rounding.

[38] Southern California Edison, 2022 Power Content Label, https://www.energy.ca.gov/filebrowser/download/6072. Accessed April 22, 2024.
[39] California Air Resources Board, Cap-and-Trade Program: Frequently Asked Questions, September 2022. https://ww2.arb.ca.gov/sites/default/files/2022-09/nc-FAQ_CT.pdf. Accessed April 22, 2024.

2. The Project does not include natural gas. GHG emissions from electricity are shown to decline in accordance with State mandates and regulations including RPS standard that requires an increasing amount of renewable energy electric utilities procure to comply with the various goals including 50 percent eligible renewable energy resources in 2030. In line with the Governor's mandate emissions in 2045 are shown to achieve the carbon neutrality goal.

Source: CalEEMod version 2022.1. Refer to **Appendix G** for model outputs.

As shown above in **Table 4.8-3** and **Table 4.8-4**, the majority of GHG emissions associated with the Project is the electricity energy use (approximately 97 percent). Because GHG emissions from covered entities are accounted for in the State's GHG future inventories and reduction targets and are subject to existing regulatory schemes to reduce emissions, those emissions are considered consistent with the 2022 Scoping Plan Update.

The Project would include a variety of energy efficiency measures including all applicable City and State green building measures such as California Code of Regulations Title 24, Part 6 (Energy Code) and Part 11 (CALGreen). The Project is designed to minimize wasteful energy consumption, with a projected PUE much lower than the average achieved by data centers. In addition, the Project would be consistent with applicable CAP goals (discussed in detail above) aimed to reduce GHG emissions.

4.9 Hazards and Hazardous Materials

This Section is based on the Phase I Environmental Site Assessment ("ESA") (Partner Engineering and Science, Inc., April 2023), which is included in its entirety in **Appendix H: Phase I Environmental Site Assessment**.

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			X	
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?		X		
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?				X
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?				X
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?				X
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			X	
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?				X

Impact Analysis

4.9a Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less Than Significant Impact. The Project involves the demolition of the existing buildings and surface parking lot and construction of the data center building, equipment yard, substation, parking, and landscaping. The Project would involve the use of common types of potentially hazardous materials such as cleaners, pesticides for landscaping, and diesel fuel for generators.

Use of these types of common materials does not create a significant hazard to the public and does not differ materially from the types of materials stored and used in traditional commercial and business operations. In addition, pursuant to MPMC Section 21.14.190(H), the Project would not routinely use a hazardous material that has a degree of hazard rating in health, flammability or reactivity of Class 4 as ranked by U.F.C. Standard 79-3 or succeeding standard. Truck trips to deliver diesel fuel and other hazardous materials are expected to reach the Project Site via SR 60, Saturn Street, Potrero Grande Drive, and possibly other local streets which connect the Project Site to nearby highways. All potentially hazardous materials used on the Project site would be contained, stored, and used in accordance with manufacturer's instructions and handled in compliance with applicable standards and regulations. In accordance with federal and State law, the Project would be required to disclose hazardous materials handled at reportable amounts. Additionally, the Project Applicant would be required to prepare an emergency response and evacuation plan, conduct hazardous materials trainings, and notify employees who work in the vicinity of hazardous materials, in accordance with federal Occupational Health and Safety Administration ("OSHA") and California Division of Occupational Safety and Health ("Cal OSHA") requirements. For transport and handling of fuel, Cal OSHA requirements include establishment of an Injury and Illness Prevention Program (CCR Title 8, Section 6760) and also specify design requirements for underground fuel storage tanks (CCR Title 8, Section 6807). Aboveground fuel storage tanks would be subject to all requirements set forth in HSC Chapter 6.67 (Sections 25270 to 25270.13).

The Los Angeles County Fire Department Health Hazardous Materials Division (Health Hazardous Materials Division) is the Certified Unified Program Agency ("CUPA") for the City. As the CUPA, the Health Hazardous Materials Division is authorized to implement the California Aboveground Petroleum Storage Act. The Health Hazardous Materials Division inspects facilities that store petroleum products in aboveground tanks for compliance with the Act and applicable sections of the federal Spill Prevention, Control, and Countermeasure ("SPCC") rule. Installation of aboveground tanks on the Project Site would be subject to this inspection, and Project operation would comply with all relevant regulations.

The Health Hazardous Materials Division also administers the California Accidental Release Prevention Program within the City. The program requires assessment of hazard potential from the storage of hazardous materials on-site and the implementation of a Risk Management Plan to minimize the risk of accidental release. The fuel storage tanks would pose a risk to soils if an accidental release of fuel occurred. A Risk Management Plan would be required for the Project to ensure the storage tanks are maintained and operated in a way that minimizes the risk of release. In the event of an accidental release, the Health Hazardous Materials Division would oversee required cleanup and remediation as required by local, State, and federal regulation. In addition, the MPMC require the Project to file a business materials usage and operations form with the Public Works Department before the approval of a certificate of occupancy. With implementation of the required permit conditions and regulatory controls outlined above, impacts related to the routine use, transport, or disposal of hazardous materials would be less than significant.

4.9b Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less Than Significant Impact with Mitigation Incorporated.

Construction

Project construction would require digging and excavation that could result in the accidental release of hazardous materials. According to the Phase I ESA conducted for the Project Site, no recognized environmental conditions ("REC") were found on-site. No historical RECs ("HREC") were identified during the Phase I ESA. However, a controlled REC ("CREC") was identified on-site. The Project Site was previously recorded on the State Water Resources Control Board ("SWRCB") GeoTracker database as a Leaking Underground Storage Tanks ("LUST") Cleanup site for three historical underground storage tanks ("UST"). The three USTs operated to supply an on-site emergency generator system associated with the former tenants of the existing building. According to a soil sampling report prepared by AEM in December 2018, upon removal of the three USTs in 2018, residual concentrations of fuel constituents were not detected above their laboratory method reporting limits in any of the collected soil or groundwater samples. In April 2020, the Los Angeles County Department of Public Works issued a letter to the Los Angeles Regional Water Quality Control Board ("LARWQCB") that indicated their review of the 2018 soil sampling report and referral of the matter to the LARWQCB for further action. A letter prepared by the LARWQCB in June 2022 determined that, based on their review of the documentation, the low concentrations of the pollutants in the areas of the three historic USTs pose low threats to human health; therefore, no further action was required. Accordingly, the risk of hazard to the public or the environment through future upset conditions is low because the CREC identified on-site has been resolved to the satisfaction of the regulatory agencies.

Furthermore, the LARWQCB indicated that there may be residual concentrations of pollutants in the soil on-site that could pose an unacceptable risk as a result of future construction/redevelopment activities and/or change to a more sensitive land use from commercial use. Responsible parties, landowners, and contractors performing subsurface activities at the Project Site should be prepared to manage properly to avoid threats to human health or the environment. The Project does not change the use of land on the site to a more sensitive use, and instead transitions the type of building on the land from one commercial use to another type of commercial use. Also note that the historical USTs and closed LUST case are considered a CREC. Thus, based on the regulatory closure, reported removal of the identified USTs, completion of assessment and remedial activities, and indicated analytical results meeting the applicable regulatory standards for commercial use, the historical USTs and closed LUST case are considered a CREC, and no further action or investigation are warranted at this time.

Nonetheless, in an abundance of caution, and because construction activities for the Project would result in temporary ground-disturbing activities Project would implement **MM HAZ-1**, which would require preparation of a Soil Management Plan (SMP) to address potential soils with residual impacts remaining on the Project Site during future construction/redevelopment activities. With implementation of **MM HAZ-1**, impacts would be reduced to less than significant.

Furthermore, due to the age of the existing building (constructed in 1979), there is a potential that asbestos-containing materials (ACMs) are present. Additionally, during the on-site visit conducted for the Phase I ESA, readily visible suspect ACMs were observed in fair to good condition. Construction of the Project would demolish the existing building and remove any existing ACM pursuant to the applicable regulatory controls that ensure ACM is not released to the environment during the demolition process. Also, in compliance with OSHA standards, a comprehensive asbestos survey of the Project Site would be completed before demolition to determine the presence, condition, friability and likely future condition of suspect or confirmed ACM. All suspect materials would be handled as ACM according to local, State, and federal regulations until the results of sampling and analysis indicate the material is a non-ACM. Therefore, compliance with pertinent regulations regarding the handling and disposal of ACM would ensure that construction of the Project would result in a less than significant impact regarding ACMs.

Operation

Given the Project's nature, the emergency generators would not be used on a consistent or routine basis. Diesel leaks are unlikely, but should they occur, they would be contained within the enclosed generator housing, which is installed on a concrete pad, thus, any spilled diesel fuel could be cleaned up without significant hazard to the public or environment. The use of diesel generators for back-up energy supply is common for many commercial operations that require power reliability.

The CUPA administers inspection of businesses that use hazardous materials or generate hazardous waste and ensures compliance with federal and State regulations listed in Response 4.9a. Facilities that store, handle, or transport hazardous materials are required to procure businesses plans and adhere to strict procedures enforced by agencies with jurisdictions over those business plans. Those facilities must also adhere to strict procedures enforced by those agencies with jurisdiction over businesses or areas that routinely use or handle hazardous materials. Project operations would comply with all CUPA, U.S. EPA, and Department of Toxic Substances Control ("DTSC") Standards.

Routine maintenance would require diesel fuel for each generator, as discussed above in **Section 4.6: Energy**. Project operations are not expected to release any hazardous materials as a result of foreseeable upset and accident conditions. The use and storage of such materials would be required to continue to occur in compliance with applicable standards and regulations, and would not pose significant hazards. It is anticipated that the use of such hazardous materials would not create a significant hazard associated with a risk of upset or accident conditions involving the release of hazardous materials during Project operations. A less than significant impact would occur in this regard.

4.9c Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

No Impact. The Project Site is not within one-quarter mile of an existing or proposed school. The nearest school is Hillcrest Elementary School located approximately 0.40-mile northeast of the Project Site. Therefore, the Project would result in no impact in this regard.

4.9d Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

No Impact. Government Code Section 65962.5 refers to the Hazardous Waste and Substances Site List, commonly known as the Cortese List, maintained by the DTSC. The Cortese list contains hazardous waste and substance sites including public drinking water wells with detectable levels of contamination, sites with known USTs having a reportable release, solid waste disposal facilities from which there is a known migration, hazardous substance sites selected for remedial action, historic Cortese sites, and sites with known toxic material identified through the abandoned site assessment program. The Project site is not identified on a compiled hazardous materials site list pursuant to California Government Code Section 65962.5. Therefore, no impact would occur.

4.9e For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

No Impact. The Project Site is not located within or near an airport land use plan. The nearest airport is the privately-owned Whittier Air Strip located approximately 2.3 miles east of the Project Site in the City of El Monte. Therefore, the Project would not result in an airport-related safety hazard or excessive noise for people working in the Project area. No impact would occur in this regard.

4.9f Would the project impair implementation of or physically interfere with an emergency response plan or emergency evacuation plan?

Less Than Significant Impact. The Project Site is located in an established urban area that is well-served by an existing roadway network. According to the Los Angeles County Department of Public Works, SR 60, located approximately 0.4-mile south of the Project Site, is designated as a freeway disaster route. Garfield Avenue, located approximately 0.7-mile west of the Project Site, is designated as a disaster route.[40] These disaster routes would not be subject to any lane closures as a result of the Project. Construction activities, particularly those associated with infrastructure improvements, may encroach adjacent roadways and may require temporary and intermittent closure of the lane closest to the Project Site along Saturn Street. Nonetheless, while such closures may cause temporary inconvenience, they would not be expected to substantially

[40] Los Angeles County Department of Public Works, City of Monterey Park, 2008, https://pw.lacounty.gov/dsg/DisasterRoutes/map/Monterey%20Park.pdf. Accessed February 7, 2024.

interfere with emergency response or evacuation plans, including the Los Angeles County Operational Area Emergency Operations Plan.[41] Furthermore, the Project would be designed according to applicable fire code standards and would provide adequate circulation and access to facilitate emergency response. Project design and access would be reviewed by MPFD to ensure that emergency access would be maintained. Therefore, the Project would not conflict with the City's adopted emergency response plan or emergency evacuation plan, and impacts would be less than significant.

4.9g Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

No Impact. The Project Site is in a fully urbanized area and it is not adjacent to any wildland. Additionally, according to the California Department of Forestry and Fire Protection (CAL FIRE), the Project Site is not within a State Responsibility Area (SRA) or a very high fire hazard severity zone (VHFHSZ); see **Section 4.20: Wildfire**. Therefore, the Project would not expose people or structures to a significant risk involving wildland fires. No impact would occur.

Mitigation Measures

MM HAZ-1 **Soil Management Plan.** Before the Building Official issues grading permits, a site-specific Soil Management Plan ("SMP") must be prepared by a qualified environmental professional approved by the City and submitted to the City of Monterey Park Building and Safety Division. The SMP must include the following elements, as applicable:

- Provisions for personal protection and monitoring exposure to construction workers,
- Requirements for construction workers to be Hazardous Waste Operations and Emergency Response ("HAZWOPER") trained,
- Procedures to be undertaken in the event that contamination is identified above action levels or previously unknown contamination is discovered,
- Procedures for the safe storage, stockpiling, and disposal of any impacted soils,
- Emergency procedures and responsible personnel.

[41] Los Angeles County, Operational Area Emergency Operations Plan, 2023, https://ceo.lacounty.gov/wp-content/uploads/2023/11/County-of-Los-Angeles-OAEOP-2023-Final-for-Website.pdf. Accessed February 16, 2024.

4.10 Hydrology and Water Quality

This Section is based on the Water Resources Technical Report (WRTR) (Fuscoe Engineering, Inc., May 2024), which is included in its entirety in **Appendix I: Water Resources Technical Report.**

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?			X	
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the projects may impede sustainable groundwater management of the basin?			X	
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
(i) Result in substantial erosion or siltation on- or off-site.			X	
(ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;			X	
(iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or			X	
iv) Impede or redirect flood flows?			X	
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?			X	
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?			X	

Impact Analysis

4.10a Would the project violate water quality or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?

Less Than Significant Impact.

Construction

The Project's construction-related activities would include demolition, excavation, grading, and trenching, which would displace soils and temporarily increase the potential for soils to be subject to wind and water erosion and may allow eroded soils and other pollutants to enter the storm drain system. Construction projects of one acre or more are regulated under the CGP, Order No. 2022-0057-DWQ, issued by the SWRCB. Projects obtain coverage by developing and implementing a SWPPP estimating sediment risk from construction activities to receiving waters and specifying BMPs that would be used to minimize pollution of stormwater.

The Project's construction contractor would be required to prepare and implement a SWPPP and associated BMPs in compliance with the CGP during grading and construction activities. Typical construction BMPs include, but are not limited to, watering soil, soil cover of inactive areas, gravel bags, and fiber rolls. Project construction activities would also comply with the requirements of MPMC Chapter 6.30, Stormwater and Urban Runoff Pollution Prevention Controls, which requires stormwater and urban runoff pollution prevention controls.

Adherence to the BMPs in the SWPPP and requirements in the MPMC would reduce, prevent, minimize, and/or treat pollutants and prevent degradation of downstream receiving waters. BMPs identified in the SWPPP would reduce or avoid contamination of stormwater with sediment and other pollutants such as trash and debris; oil, grease, fuels, and other toxic chemicals; paint, concrete asphalt, etc.; and nutrients. Therefore, water quality and waste discharge impacts from Project demolition, grading, and construction activities would be less than significant.

Operation

Operation-related activities of the Project would generate pollutants that could adversely affect the water quality of downstream receiving waters if effective measures are not used to keep pollutants out of and remove pollutants from urban runoff. Requirements for waste discharges to stormwater from operation of developed land uses within the coastal watersheds of Los Angeles and Ventura Counties are in the Regional Phase I Municipal Separate Storm Sewer System NPDES Permit (MS4 Permit), Order NO. R4-2021-0105, issued by the LARWQCB in 2021. Los Angeles County has a LID Standards Manual on developing water quality management plans for projects and selecting stormwater control and source control BMPs in addition to other LID strategies. To meet the local MS4 permit and LID requirements consistent with the County's LID Ordinance and LID Standards Manual, stormwater management strategies would be implemented throughout the Project Site.

The LID Manual establishes an order of priority of LID BMPs when screening potentially feasible LID BMPs:

1. infiltration systems
2. stormwater capture and use
3. high efficiency biofiltration/bioretention systems, and
4. combination of any of the above.

According to the Geotechnical Investigation prepared for the Project, infiltration is not considered geotechnically feasible and is therefore not recommended. The next BMP strategy on the list, Capture and Use, is also not recommended by the WRTR as there are limited landscaped areas with appropriate water demand for the captured runoff to be directed to. The Project would therefore implement the next BMP strategy, biofiltration BMPs, in the form of six bioretention planter boxes along the western and eastern ends of the proposed data center building, that would be designed to accommodate an 85th percentile (0.9-inch), 24-hour storm. As the existing Project Site does not have any structural or LID BMPs on-site, implementation of the proposed LID features would significantly improve surface water quality runoff compared to existing conditions. Additionally, Project operation itself would not result in discharges that would cause regulatory standards to be violated in the Los Angeles River Watershed. Therefore, water quality and waste discharge impacts from Project operation would be less than significant.

For the reasons expounded above, Project impacts to water quality and waste discharge would be less than significant.

4.10b Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less Than Significant Impact. The City overlies the Central Subbasin of the Los Angeles Coastal Plain Groundwater Basin. The Central Basin is divided into three sections: the Los Angeles Forebay, the Montebello Forebay, and the Whittier Area. The two forebays represent areas of unconfined aquifers that allow percolation of surface water down into the deeper aquifers to replenish the basins. The Whittier Area is a confined aquifer system that is replenished primarily from the upgradient forebays and adjacent groundwater basins.

The Project would not include any groundwater pumping and would instead rely on the local water purveyor for water. Additionally, no water supply wells are located at or within one thousand feet of the Project Site. The Project would not include the construction of any water supply wells, nor would the Project impact any existing water supply wells. Furthermore, as stated in Response 4.7a.iii, groundwater was not encountered in any of the exploratory borings performed on-site to the maximum depth of 36.5 bgs, and dewatering is not anticipated for the Project. The Project Site is also not within a groundwater recharge area or facility, nor does it represent a source of groundwater recharge. Therefore, the Project would not substantially deplete groundwater supplies nor interfere substantially with groundwater recharge such that the Project would impede the basins' sustainable groundwater management, and impacts would be less than significant.

4.10c.i Would the project substantially alter the existing drainage pattern of the site or area, including through the alterations of the course of stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site?

Less Than Significant Impact. See response to Response 4.10a, above. The construction contractor would be responsible for preparation and implementation of a SWPPP in compliance with LARWQCB's GCP. This includes maintenance of BMPs during the life of the Project and submittal of the annual reports.

Upon Project development, the Project would include LID biofiltration BMPs in the form of new bioretention planter boxes that would accommodate an 85th percentile (0.9-inch), 24-hour storm, consistent with the requirements of the MS4 Permit and LID Standards Manual. Compliance with existing regulations and BMPs developed to minimize erosion and siltation would reduce this impact to a less than significant level. Project infrastructure would connect to existing off-site storm drain infrastructure, and no upgrades or expansion of such off-site facilities would occur with Project implementation. Standard BMPs designed to prevent erosion during and after construction, as well as the introduction of pervious land uses in the Project Site, would slow stormwater runoff velocities and allow sediment to settle out of the water, and the nature of drainage patterns on the Project Site would capture trash and debris and restrict flow of debris into the storm drain system. Water runoff would be minimized to the extent possible, and the Project would comply with the requirements of the MS4 Permit. The Project would be designed to meet local, State, and federal water quality standards and to ensure that stormwater flows do not result in substantial erosion or siltation.

Therefore, post-development runoff would be adequately handled by the Project's drainage system and would not exceed the capacity of existing or planned stormwater drainage systems or substantially alter the existing drainage pattern of the Project Site or area in a manner that would result in flooding on- or off-site. Therefore, Project impacts would be less than significant.

4.10c.ii Would the project substantially alter the existing drainage pattern of the site or area, including through the alterations of the course of stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Less Than Significant Impact. See response to Response 4.10c.i, above.

Project development would decrease the amount of impervious surfaces on the Project Site from 66 percent to 62 percent. On-site runoff from the Project Site would be collected in the new bioretention planter boxes, which would accommodate an 85th percentile (0.9-inch), 24-hour storm. The WRTR includes an analysis of the 10-year, 25-year, and 50-year frequency design storm events for existing and proposed conditions; see **Table 4.10-1: Existing Versus Proposed Conditions for 10-Year, 25-Year, and 50-Year Storm Events**.

Table 4.10-1: Existing Versus Proposed Conditions for 10-Year, 25-Year, and 50-Year Storm Events		
10-Year Storm Event		
Condition	**% Imperviousness**	**Q_{10} (cfs)**
Existing	66	23.2
Proposed	62	21.4
25-Year Storm Event		
Condition	**% Imperviousness**	**Q_{25} (cfs)**
Existing	66	31.5
Proposed	62	28.8
50-Year Storm Event		
Condition	**% Imperviousness**	**Q_{50} (cfs)**
Existing	66	36.1
Proposed	62	34.4
Q = peak flow for the 10-year, 25-year, and 50-year storm events; cfs = cubic feet per second Source: Fuscoe Engineering, Inc., Water Resources Technical Report, 2024.		

Based on the results of **Table 4.10-1**, implementation of the Project would decrease the peak flow discharge for the 10-year, 25-year, and 50-year events as compared to existing conditions. Accordingly, the Project would not result in on- or off-site flooding.

Therefore, post-development runoff would be adequately handled by the Project's drainage system and would not exceed the capacity of existing or planned stormwater drainage systems or substantially alter the existing drainage pattern of the Project Site or area in a manner that would result in flooding on- or off-site, and impacts would be less than significant.

4.10c.iii Would the project substantially alter the existing drainage pattern of the site or area, including through the alterations of the course of stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Less Than Significant Impact. As described above in Responses 4.10a and 4.10c.i, Project impacts on the capacity of storm drainage systems and stormwater pollution would be less than significant.

4.10c.iv Would the project substantially alter the existing drainage pattern of the site or area, including through the alterations of the course of stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows?

Less Than Significant Impact. According to the WRTR, the Project Site is located within a flood hazard area identified by the Federal Emergency Management Agency (FEMA) as Zone X, which is defined as an area outside of the 0.2 percent (500-year) annual chance floodplain. However, the Project Site is located within the dam inundation area of the Garvey Reservoir. The Garvey Reservoir is a reservoir located approximately 0.4-mile north of the Project Site that is impounded by three embankment dams.

Garvey Reservoir is classified by the State Department of Water Resources, Division of Safety of Dams (DSOD) as an extremely high downstream hazard. However, as of September 2023, the

dam was given a Satisfactory Condition Assessment by the DSOD, and no existing or potential dam safety deficiencies were recognized.[42] Acceptable performance is expected under all types of loading conditions (static, hydrologic, seismic) in accordance with the minimum applicable State or federal regulatory criteria or tolerable risk guidelines. FEMA requires that all dam owners develop Emergency Action Plans (EAPs) for warning, evacuation, and post-flood actions. An EAP identifies potential emergency conditions at a dam and specifies actions to be followed to help minimize loss of life and property damage should those conditions occur. EAPs include procedures dam owners will follow to issue early warning and notification messages to responsible downstream emergency management authorities. EAPs also include inundation maps to help dam owners and emergency management authorities identify critical infrastructure and population-at-risk sites that may require protective measures, warning, and evacuation planning. Thus, the potential for dam flooding at the Project Site is considered low. Therefore, the Project would not impede or redirect flood flows, and impacts would be less than significant.

4.10d Would the project in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Less Than Significant Impact. As noted in Response 4.10c.iv, the Project Site is in an area of minimal flood hazard. Although the Project Site is within the dam inundation area of the Garvey Reservoir, as of September 2023, no existing or potential dam safety deficiencies were recognized, and acceptable performance is expected under all types of loading conditions. Thus, the potential for dam flooding at the Project Site is considered low.

Tsunamis are sea waves that are generated in response to large-magnitude earthquakes. When these waves reach shorelines, they sometimes produce coastal flooding. The Project Site is located approximately 22 miles inland from Pacific Ocean and is therefore not at risk of tsunami.

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. There are two aboveground water tanks associated with the La Loma Reservoir located upslope of the Project Site to the northwest. Seiches have the potential to develop within the water tanks during seismic events. However, such tanks are required to be designed and constructed in compliance with the American Water Works Association Standards for Design of Steel Water Tanks to reduce the potential for seiches in water tanks where overflow or structural failure may result in damage to nearby properties. As the water tanks are designed in compliance with these design standards, the likelihood for seiches within the water tanks is low. Therefore, impacts regarding seiches are less than significant.

Based on the reasons above, the Project would not risk release of pollutants due to floods, tsunami, or seiche. Therefore, impacts would be less than significant.

[42] California Department of Water Resources, Division of Safety of Dams. Dams Within Jurisdiction of the State of California, 2023, page 36, https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/All-Programs/Division-of-Safety-of-Dams/Files/Publications/DAMS-WITHIN-JURISDICTION-OF-THE-STATE-OF-CALIFORNIA-LISTED-ALPHABETICALLY-BY-DAM-NAME-SEPTEMBER-2023.pdf. Accessed March 20, 2024.

4.10e Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less Than Significant Impact. As substantiated in Response 4.10a, through compliance with pertinent existing laws and regulations, the Project would not violate any water quality standards and therefore would not obstruct the implementation of a water quality control plan.

The Project Site is in the Los Angeles Coastal Plain Groundwater Basin, which is identified by the Sustainable Groundwater Management Act (SGMA) as a very low priority basin.[43] The SGMA requires only medium- and high-priority basins to form groundwater sustainability agencies, develop groundwater sustainability plans, and manage groundwater for long-term sustainability. Therefore, the San Gabriel Valley Basin does not require a sustainable groundwater management plan. Additionally, as further detailed in Response 4.10b, the Project would not decrease groundwater supplies or interfere substantially with groundwater recharge. Therefore, impacts would be less than significant.

[43] Sustainable Groundwater Management Agency, SGMA Data Viewer, https://sgma.water.ca.gov/webgis/?appid=SGMADataViewer#boundaries. Accessed March 21, 2024.

4.11 Land Use and Planning

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Physically divide an established community?				X
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?				X

Impact Analysis

4.11a Would the project physically divide an established community?

No Impact. The Project Site is developed with a commercial office building, associated surface parking lot, and grass lot, and is surrounded by office, residential, and utility uses. No new streets or other physical barriers which could physically divide an established community are proposed. Although established residential neighborhoods lie to the north and west of the Project Site, Project development would not physically divide these neighborhoods in any way because the Project would be developed within the Project Site, and all off-site infrastructure improvements would be contained within roadways adjacent to the Project Site such that they would not transect those neighborhoods. Access to the existing residential neighborhoods would not be impeded or cut off as a result of Project development. Therefore, the Project would not physically divide an established community. No impact would occur in this regard.

4.11b Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

No Impact.

General Plan

The Project Site has a General Plan land use designation of Innovation/Technology. The primary uses allowed within this land use designation include research and development, light manufacturing, service commercial, professional offices, entertainment, and breweries/wineries/distilleries. The General Plan states that the “Saturn Park district provides prime properties, easy access to arterial roadways and freeways, and locations near housing perfect for new, clean technology, and creative industries." The General Plan also states that “Saturn Park will continue to function as a business park focused on the office-type and research and development uses, with supportive commercial businesses.” The Project would develop a data center facility, which is a type of new clean technology industry, and is thereby consistent with the types of uses, and intent of, the General Plan for properties designated as Innovation/Technology.

In addition, the Project is consistent with the applicable goals and policies of the General Plan, including but not limited to the following. Goal 25: Saturn Park as a destination business park for high-quality service industry, research and development, and emerging industry jobs – aligns with the Project because it would redevelop a vacant parcel with a new emerging industry (data center) use that facilitates the goal of making Saturn Park a destination business park. In addition, the Project is consistent with Policy 25.2, which is to "market the Saturn Park district as a premier location in the San Gabriel Valley for emerging technology business" because the Project would redevelop the currently underutilized site with a quality emerging technology business. The Project proposes to develop a data center, which is a permitted use within the Innovation/Technology General Plan land use designation. Furthermore, the maximum FAR for the Innovation/Technology designation is 0.60. The proposed FAR for the Project is 0.32, which is below the maximum permitted FAR.

Further, Project development would not include or require any amendments to the General Plan. Finally, Project compliance with the General Plan would be verified through the City's development review process. Therefore, the Project would not conflict with the any of the City's land use plan, policies, or regulations that have been adopted for the purpose of avoiding or mitigating an environmental effect, and no land use conflict related to General Plan consistency is expected to occur.

Zoning

The Project Site is zoned Office Professional (Voter Enacted) (O-P). Principal uses permitted in this zone include data processing facilities. The O-P Zone is intended to provide for the development of integrated professional, office and limited retail areas that exhibit a diversity of business activity from both revenue and service quality standpoints, and which are compatible and responsive to abutting land uses, including residential developments. The Project would be subject to compliance with the O-P development standards specified in MPMC Chapter 21.14, O-P – Office Professional Zone (Voter Enacted), which would be verified through the City's plan check review process. In addition, the Project is seeking a Development Agreement and activation of the BRDZ for the Project Site.

The Project would be required to provide 848 parking spaces per Table 21.22(C) of MPMC Section 21.22.120, Minimum Parking Spaces Required. As the projected number of employees would require far fewer parking spaces than what is prescribed in the MPMC, the Applicant is requesting a demand-based parking reduction. The reduced demand for on-site parking is a beneficial element of the Project because the Project generates far less vehicle trips than other commercial uses that could occupy the Site under the current zoning. Upon City approval, the Project would include 68 parking spaces adjacent to the eastern and northern sides of the proposed data center building. Similarly, the Applicant has requested a CUP for development on a lot size over one acre, and if needed, a CUP for mechanical equipment height, both of which are permitted by the MPMC. Also as permitted by the MPMC, the Development Agreement would contain zoning standards activated by the BRDZ for the Project characteristics analyzed herein.

Therefore, the Project would not conflict with the O-P Zone or BRDZ designation's intended uses and standards. Therefore, the Project would be consistent with the zoning of the Project site, and no land use conflict related to zoning consistency would occur.

Overall, the Project would be consistent with the land use and zoning of the Project Site, and no impact would occur.

4.12 Mineral Resources

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				X
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?				X

Impact Analysis

4.12a Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

4.12b Would the project result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

No Impact. According to the California Geological Survey, the Project Site is within the San Gabriel Production-Consumption Region. However, the Project Site is not within a designated Resource Sector within the region, which are areas classified as containing significant aggregate resources (i.e., within Mineral Resource Zone 2) and not precluded from mining by incompatible land uses.[44] The entire City is urbanized, and past land use changes to accommodate planned urbanization preclude mining activities in the City. Furthermore, the City's General Plan does not include any locally-important mineral resource recovery sites.[45] Therefore, mining would not be feasible, and the City is not considered to be a potential future source for mineral resources. Additionally, the Project Site and immediate vicinity currently does not contain any active mining or drilling operations.[46,47] Therefore, the Project would not result in the loss of availability of a known mineral resource or a locally-important mineral resource recovery site. No impact would occur in this regard.

4.13 Noise

This Section is based on the *Noise and Vibration Analysis Memorandum* (Kimley-Horn, September 2024), which is included in **Appendix J: Noise and Vibration Analysis Memorandum**, and **Appendix A-2: Offsite Improvements for Southern California Service.**

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?			X	
b) Generate of excessive ground borne vibration or groundborne noise levels?			X	
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?				X

Regulatory Setting

To limit population exposure to physically or psychologically damaging as well as intrusive noise levels, the Federal government, the State of California, various county governments, and most municipalities in the State have established standards and ordinances to control noise.

Federal

Federal Transit Administration Noise and Vibration Guidance

The Federal Transit Administration (FTA) has published the Transit Noise and Vibration Impact Assessment Manual (FTA Transit Noise and Vibration Manual) to provide guidance on procedures for assessing impacts at different stages of transit project development. The report covers both construction and operational noise impacts and describes a range of measures for controlling excessive noise and vibration. In general, the primary concern regarding vibration relates to potential damage from construction. The guidance document establishes criteria for evaluating the potential for damage for various structural categories from vibration.

State

California Government Code

California Government Code Section 65302(f) mandates that the legislative body of each county and city adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines established by the State Department of

Health Services. The guidelines rank noise land use compatibility in terms of "normally acceptable," "conditionally acceptable," "normally unacceptable," and "clearly unacceptable" noise levels for various land use types. Single-family homes are "normally acceptable" in exterior noise environments up to 60 CNEL and "conditionally acceptable" up to 70 CNEL. Multiple-family residential uses are "normally acceptable" up to 65 CNEL and "conditionally acceptable" up to 70 CNEL. Schools, libraries, and churches are "normally acceptable" up to 70 CNEL, as are office buildings and business, commercial, and professional uses.

Title 24 – Building Code

The State's noise insulation standards are codified in the California Code of Regulations, Title 24: Part 1, Building Standards Administrative Code, and Part 2, California Building Code. These noise standards are applied to new construction in California for interior noise compatibility from exterior noise sources. The regulations specify that acoustical studies must be prepared when noise-sensitive structures, such as residential buildings, schools, or hospitals, are located near major transportation noise sources, and where such noise sources create an exterior noise level of 65 dBA CNEL or higher. Acoustical studies that accompany building plans must demonstrate that the structure has been designed to limit interior noise in habitable rooms to acceptable noise levels. For new multi-family residential buildings, the acceptable interior noise limit for new construction is 45 dBA CNEL.

Groundborne Vibration

Caltrans' *Transportation and Construction Vibration Manual* provides thresholds of vibration for building damage and human annoyance. Based on the Caltrans criteria, construction vibration impacts would be significant if vibration levels exceed 0.5 inches per second (in/sec) peak particle velocity (PPV) at older residential structures, which is the limit for potential building damage at these structures. For human annoyance, construction vibration impacts would be significant if vibration levels exceed 0.25 in/sec PPV at the nearest structure.[48]

Local

City of Monterey Park General Plan

The City of Monterey Park Noise Standards are developed from those of several federal and State agencies including the Federal Highway Administration (FHWA), the U.S. EPA, the Department of Housing and Urban Development (HUD), the American National Standards Institute (ANSI), and the State of California Department of Health Services. These standards set limits on the noise exposure level for various land uses. As with the California Noise Standards described above, these General Plan standards are related to the siting of land uses and are not typically used as thresholds of significance for determining noise impacts associated with construction and operation of the Project. However, the standards do provide a means for judging whether an existing noise environment would be compatible with development of a new noise-sensitive land use or whether a new use would create an incompatible noise environment for existing noise-sensitive uses. The General Plan does not have a Noise Element; however, the Safety Element

[48] Caltrans, Transportation and Construction Vibration Guidance Manual, 2020.

provides specific objectives to ensure that City residents will be protected from excessive noise. The other elements of the 2022 General Plan do not have policies related to noise or vibration. The following policies from the Safety Element are applicable to the Project:

Safety Element

Goal 12: Minimize the impact of point-source noises and ambient noise levels throughout the community.

Policy 12.1: Continue to enforce the noise regulations within the Monterey Park Municipal Code (MPMC) to control point-source noise.

Policy 12.2: Incorporate noise impact considerations into the development review process**,** particularly the relationship of parking and ingress/egress, loading, and refuse collection areas to surrounding residential and other noise-sensitive land uses.

Policy 12.4: Enforce and revise as necessary City regulations regulating hours for construction activity.

City of Monterey Park Municipal Code

MPMC Section 21.14.150, Compressors, Air-Conditioning Units or Similar Mechanical Equipment, requires that mechanical equipment located on the roof and outside of the exterior walls of the any building zoned in an office-professional zone must be installed with permanent sound-proofing measures and must comply with the noise standards set forth in Chapter 4.50, Regulation of Noise and Other Disturbances.[49] MPMC Chapter 4.50 has established noise standards for residential, commercial, and industrial uses. MPMC Section 4.50.080, Sound Level Limits – Established, states that ambient noise levels must not exceed the measured median ambient noise levels or the following presumed ambient noise levels identified in **Table 4.13-1: Established Sound Level Limits** below, whichever is greater:

Table 4.13-1: Established Sound Level Limits

Land Use	Time Period	Level
Residential	Nighttime	50 dBA
	Daytime	55 dBA
Neighborhood Commercial	Anytime	60 dBA
Other Commercial	Anytime	65 dBA
Industrial	Anytime	70 dBA

Source: City of Monterey Park Municipal Code Chapter 4.50 Regulation of Noise and other Disturbances.

MPMC Chapter 4.50, Regulation of Noise and Other Disturbances, provides specific noise restrictions and exceptions for noise sources within the City. MPMC Section 4.50.100, Sound Level Limits – Exceptions, states that construction activities between 7:00 A.M. and 7:00 P.M.

[49] MPMC Section 21.14.150 requires equipment to comply with standards set in MPMC Chapter 9.53. However, MPMC Chapter 9.53 was repealed, and Chapter 4.50 was added to regulate noise in the City during the Monterey Park City Council Meeting held on March 3, 2021.

Monday through Friday, and between 9:00 A.M. and 6:00 P.M. on Saturdays, Sundays, and Holidays are not subject to the noise level limits established in the MPMC.

Existing Conditions

Existing Noise Sources

Mobile noise sources, especially cars, trucks, motorcycles, and aircraft, are the City's most common and substantial noise sources. The existing mobile noise sources in the Project area are the motor vehicles traveling on Saturn Street, South Orange Avenue, and Potrero Grande Drive. The primary stationary noise sources in the Project vicinity are those associated with the surrounding industrial, commercial, and residential uses. Such stationary noise sources include mechanical equipment (e.g., heating, ventilation, and air conditioning [HVAC] equipment and substation equipment), parking lot noise, moving vehicles, music playing, dogs barking, and people talking. The noise associated with these sources may represent a single-event noise occurrence or short-term noise.

Noise Measurements

To quantify existing ambient noise levels in the Project area, Veneklasen Associates conducted three short-term noise measurements and two long-term measurements on January 31, 2024; see Attachment B of **Appendix J**. The noise measurement sites were representative of typical existing noise exposure within and immediately adjacent to the Project Site; see **Figure 4.13-1: Noise Measurement Locations**. The noise levels and sources of noise measured at each location are listed in **Table 4.13-2: Existing Noise Measurements**.

Table 4.13-2: Existing Noise Measurements

Site	Location	Average Level (dBA)	Daytime Level (dBA)	Nighttime Level (dBA)
ST-1	Southwest corner of the existing building on-site	64	-	-
ST-2	Northwest corner of the existing Project Site	64	-	-
ST-3	Southeast corner of the Project Site	65	-	-
LT-1	West edge of the Project Site by the residences along Iris Way	55	56	54
LT-2	Northeast corner of the Project Site by Orange Avenue	60	61	56

Sensitive Receptors

Noise exposure standards and guidelines for various types of land uses reflect varying noise sensitivities associated with uses. As stated in the General Plan Safety Element, land uses considered sensitive receptors include residences, playgrounds, childcare centers, long-term health facilities, hospitals, schools, childcare facilities, and places of assembly. As shown in **Table 4.13-3: Sensitive Receptors,** sensitive land uses surrounding the Project consist of mostly residential communities to the north, east, west of the Project Site. To quantify noise exposure levels near the Project Site, the long-term noise measurement locations (see **Figure 4.13-1: Noise Measurement Locations**) were chosen for proximity to sensitive receptors including:

Table 4.13-3: Sensitive Receptors

Receptor Description	Distance and Direction[1]
Single-Family Residences	65 feet west
Single-Family Residences	165 feet northeast

1. Distance measured from the Project site boundary to the sensitive receptor property line.

Impact Analysis

4.13a Would the project result in generation a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less Than Significant Impact.

Construction Noise

Construction noise typically occurs intermittently and varies depending on the nature or phase of construction. Noise generated by construction equipment can reach high levels. During construction, exterior noise levels could affect the noise-sensitive receptors near the construction site. Construction activities would include demolition, site preparation, grading, building construction, paving, and architectural coating. Such activities may require excavators, dozers, and concrete saws during demolition; tractors and dozers during site preparation; cranes, forklifts, generator sets, tractors, and welders during building construction; pavers, paving equipment, and rollers during paving; and forklifts, generator sets, welders, and air compressors during interior building construction. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 to 4 minutes at lower power settings. Other primary sources of acoustical disturbance would be random incidents, which would last less than one minute (such as dropping large pieces of equipment or the hydraulic movement of machinery lifts). Noise generated by construction equipment, including dozers, excavators, loaders, forklifts, and air compressors, can reach high levels. L_{max} is the maximum level of a noise source environment and is often used as a threshold value for typical noise levels of construction activities. Typical noise levels associated with individual construction equipment are listed in **Table 4.13-4: Typical Construction Noise Levels.**

1. Calculated using the inverse square law formula for sound attenuation: $dBA_2 = dBA_1+20Log(d_1/d_2)$
2. Where: dBA_2 = estimated noise level at receptor; dBA_1 = reference noise level; d_1 = reference distance; d_2 = receptor location distance.

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, September 2018.

Daytime construction noise is not typically a concern for human health and is a common occurrence within the urban environment. Construction activity between the hours of 7:00 A.M. and 7:00 P.M. Monday through Friday, and between 9:00 A.M. and 6:00 P.M. on Saturdays, Sundays, and Holidays are exempt from the MPMC noise standards. Although construction is not expected to occur outside of these times, a construction noise impact analysis, estimating the potential temporary increase in ambient noise, is performed in accordance with the FTA thresholds.

The Project's existing surroundings include both residential and commercial uses. Following the FTA methodology for quantitative construction noise assessments, FHWA's Roadway Construction Noise Model (RCNM) was used to predict construction noise. All construction

equipment is assumed to operate at the main construction area of the Project Site.[50] During construction, equipment would be operating throughout the Project Site and not all equipment would be operating at the point closest to the sensitive receptors. The main construction activity area for the Project would occur mainly around the center of the Project Site due to the building location and orientation. Therefore, the distance used in the model was approximately 530 feet from the center of the Project Site to the nearest sensitive receptor (adjacent to the Project Site to the west) and 380 feet to the nearest commercial receptor to the south; refer to **Appendix J** for construction noise modeling results. The MPMC does not establish quantitative construction noise standards, and Section 4.50.100(a) of the MPMC provides that construction activities are not subject to the noise level limits established in the MPMC. Nonetheless, for informational purposes only, this analysis conservatively uses the FTA's criteria of 80 dBA L_{eq} for residential uses and 85 dBA L_{eq} for commercial uses to evaluate construction noise impacts.[51]

Table 4.13-5: Construction Noise Level shows the maximum noise levels for each individual construction phase, assuming simultaneous use of equipment assumed for each phase. The highest exterior noise level at the residential use located to the west of the Project Site is estimated to be 67.1 dBA L_{eq}, which would not exceed the FTA's criteria of 80 dBA L_{eq} for residential uses. The highest exterior noise level during the offsite improvements at the residential use located to the north of the Project Site is estimated to be 72.0 dBA L_{eq}, which would not exceed the FTA's criteria of 80 dBA L_{eq} for residential uses. At the nearest commercial use approximately 380 feet south, the highest noise level would be 70.0 dBA L_{eq}, which would not exceed the FTA's criteria of 85 dBA L_{eq} for commercial uses.

Table 4.13-5: Construction Noise Levels

Construction Phase	Receptor Location			Modeled Exterior Noise Level (dBA L_{eq})[2,3]	Noise Threshold (dBA L_{eq})[4]	Exceeded?
	Land Use	Direction	Distance (feet)[1]			
Phase 1 Demolition	Commercial	South	380	68.8	85	No
Phase 1 Demolition	SFR	West	530	65.9	80	No
Phase 1 Demolition	SFR	Northeast	680	63.8	80	No
Phase 1 Site Prep	Commercial	South	380	70.0	85	No
Phase 1 Site Prep	SFR	West	530	67.1	80	No
Phase 1 Site Prep	SFR	Northeast	680	65.0	80	No
Phase 1 Grading	Commercial	South	380	69.7	85	No
Phase 1 Grading	SFR	West	530	66.8	80	No
Phase 1 Grading	SFR	Northeast	680	64.6	80	No
Phase 1 BC	Commercial	South	380	68.5	85	No
Phase 1 BC	SFR	West	530	65.6	80	No
Phase 1 BC	SFR	Northeast	680	63.4	80	No

[50] For the purposes of this analysis, the main construction activity areas are defined as the anticipated building construction area. Although some construction activities may occur at distances closer than 380 feet from the nearest properties, construction equipment would be dispersed throughout the Project Site during various construction activities. Therefore, main construction activity areas represent the most appropriate distance based on the sporadic nature of construction activities.

[51] Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, Table 7-3, page 179.

Phase 1 Paving	Commercial	South	380	68.9	85	No
Phase 1 Paving	SFR	West	530	66.0	80	No
Phase 1 Paving	SFR	Northeast	680	63.9	80	No
Phase 2 IC	Commercial	South	380	62.7	85	No
Phase 2 IC	SFR	West	530	59.9	80	No
Phase 2 IC	SFR	Northeast	680	57.7	80	No
Phase 2 Arch. Coating	Commercial	South	380	56.1	85	No
Phase 2 Arch. Coating	SFR	West	530	53.2	80	No
Phase 2 Arch. Coating	SFR	Northeast	680	51.1	80	No
Offsite Improvements	SFR	North	200	72.0	80	No

1. Distance is from the nearest receptor to the main construction activity area on the Project site. Not all equipment would operate at the closest distance to the receptor.
2. Modeled noise levels conservatively assume the simultaneous operation of all pieces of equipment.
3. The FTA Noise and Vibration Manual establishes construction noise standards of 80 dBA $L_{eq(8\text{-}hour)}$ for residential uses.

Abbreviations: SFR – Single-Family Residence, BC – Building Construction, IC – Interior Construction

Source: Federal Highway Administration, Roadway Construction Noise Model, 2006. Refer to Attachment A of **Appendix J** and Attachment A of **Appendix A-2** for noise modeling results.

Although the noise generated by Project construction would be higher than ambient noise levels, construction would be temporary and cease once Project construction is completed. Construction activities would comply with General Plan Policy 12.4 and MPMC Section 4.50.100, Sound Level Limits – Exceptions, and limit construction between the hours of 7:00 A.M. and 7:00 P.M. Monday through Friday, and between 9:00 A.M. and 6:00 P.M. on Saturdays, Sundays, and Holidays are exempt from the MPMC noise standards. While construction may cause short-term annoyance to adjacent uses, it would be temporary and restricted to the hours permitted by the City's noise ordinance. In any case, the MPMC exempts noise from construction activities from the noise level limits established in the MPMC. Therefore, construction noise impacts would be less than significant.

Operational Noise

Project implementation would introduce new noise sources in the Project vicinity. The Project's primary noise sources that could potentially impact nearby noise-sensitive land uses include, mechanical equipment (e.g., cooling equipment, generators, etc.), parking lot (daily arrival and departure of cars), and loading dock/truck noise. The Project's mechanical equipment noise modeling was analyzed in the Exterior Noise and Exterior Façade Acoustical Analysis provided by Veneklasen Associates (see Attachment B of **Appendix J**).

As indicated above, the MPMC Section 21.14.150, Compressors, Air-Conditioning Units or Similar Mechanical Equipment, limits noise levels generated by mechanical equipment to the measured median ambient noise level or the presumed ambient noise levels listed in **Table 4.13-1**, whichever is greater, per Chapter 4.50, Regulation of Noise and Other Disturbances.[52] As shown in **Table 4.13-2**, the ambient noise level at the nearest residences would be above the presumed ambient noise levels and therefore should be used as the ambient noise requirement for the site. The ambient noise requirement would be 56 dBA L_{eq} during the daytime and 54 dBA L_{eq} during

[52] As described above, Chapter 9.53 was repealed, and Chapter 4.50 was added during a Monterey Park City Council Meeting on May 3, 2021.

the nighttime for the single-family residences to the west, and 61 dBA L_{eq} during the daytime and 56 dBA L_{eq} during the nighttime for the single-family residences to the northeast. At the nearest commercial receptor, the presumed median ambient noise requirement would be 65 dBA L_{eq}.

Mechanical Equipment

Potential stationary noise sources related to long-term Project operations include mechanical equipment (e.g., chillers and generators). The modeling utilized the 2023 SoftNoise Predictor computer program to calculate noise due to the chillers and generators at the nearest receptors. Chiller units would be surrounded by a 16-foot absorptive barrier on the rooftop on the proposed Project building. The chiller units were conservatively modeled to operate for 24-hours at 100 percent capacity. The generators would be located outside along the north face of the building surrounded by a 20-foot precast screen wall. Generator noise would occur during generator testing (a monthly process by which each generator is started and run for short durations, typically 15-30 minutes, with only one generator being tested at a time; monthly testing would occur during daytime hours only) or during emergency situations (typically defined as the interruption of grid provided power during which up to 12 of the generators, depending on the demand of the data center, would provide electricity until grid power is restored). Section 4.50.050, Noise Disturbances – Exemptions, of the MPMC states that generators used during an emergency situation are exempt from the noise standards. Therefore, the noise levels generated for generators running during emergency situations were not evaluated.

As indicated in **Table 4.13-6: Mechanical Equipment Noise Levels**, noise levels from the different mechanical equipment operating scenarios would be below the ambient noise levels and would not exceed the City's standards. Therefore, the Project would result in less than significant impacts concerning mechanical equipment noise levels.

Table 4.13-6: Mechanical Equipment Noise Levels

Receptor	Project Operational Noise Level - Daytime (dBA L_{eq})[1]	Ambient Noise Level - Daytime (dBA L_{eq})[2]	Exceed?	Project Operational Noise Level - Nighttime (dBA L_{eq})	Ambient Noise Level - Nighttime (dBA L_{eq})[2]	Exceed?
Single Family Residences (West)	50	56	No	50	54	No
Single Family Residences (Northeast)	56	61	No	56	56	No
Commercial Use (Northeast)	55	65	No	55	65	No

1. Ambient daytime noise levels include the operations of the two generators closest to sensitive receptors for generator testing.
2. Per MPMC Section 4.50.080, the generated noise levels must not exceed the median ambient noise level at the receptors or the measured ambient noise level, whichever is greater.

Source: Refer to Attachment B of **Appendix J** for noise modeling results.

Loading Dock and Trash/Recycling Truck Pickups

During loading activities and trash and recycling pickups, noise would be generated by the trucks' diesel engines, exhaust systems, and brakes during low gear shifting' braking activities; opening and closing of the trash/recycling bins. The Project would have two loading docks and trash enclosures located in the northwest and northeast corner of the proposed Project building. The typical loading dock/trash pickup noise level is approximately 64 dBA L_{eq} at 50 feet. Truck loading and trash pickup would be infrequent and during the daytime hours. Therefore, on-site loading dock noise and trash/recycling pickup noise would not materially contribute to increases in daytime ambient noise. When weighted over a 12-hour period, truck loading/trash pickup noise would be 54 dBA L_{eq} at 50 feet. At the nearest sensitive receptor to the west and northeast, the noise level would be approximately 42 dBA L_{eq} and 38 dBA L_{eq} respectively without accounting for any surrounding attenuation features. The hours of deliveries and trash/recycling pickup activity would be dependent on the MPMC and the service provider. Therefore, the Project's truck loading/trash pickup noise level would not significantly impact the Project's contribution to the daytime ambient noise levels at the surrounding receptors and would result in less than significant impacts.

Mobile Traffic Noise

The Project is anticipated to generate 52 daily trips, with up to 36 trips during the day and up to 16 trips during the night.[53] In general, a 3-dBA increase in traffic noise is barely perceptible to people while a 5-dBA increase is readily noticeable. Traffic volumes on Project area roadways would have to approximately double for the resulting traffic noise levels to generate a barely perceptible 3-dBA increase.[54] Saturn Street is classified in the City General Plan Circulation Element as a Minor Arterial that supports up to 40,000 vehicles per day. According to Replica Traffic Data, Saturn Street currently carries 889 vehicles per day.[55] As noted above, the Project would result in approximately 52 daily trips, which would not result in a doubling of existing traffic volumes on Saturn Street, or nearby through streets. The Project would not generate enough traffic to result in a noticeable 3-dBA increase in ambient noise levels. Therefore, the Project would result in a less than significant impact from Project-related traffic noise.

Parking

Parking stalls would be located along the east of the proposed Project building. As explained above, the Project would not generate a substantial amount of trips and parking activities would be minimal on-site. Parking activities would anticipate a maximum of 18 vehicles during the day and 8 vehicles during the night.[56] Therefore, noise levels generated by Project parking would be at a 1-hour maximum of 39 dBA L_{eq} at 50 feet during the day and 35 dBA L_{eq} at 50 feet during the night. Due to the variability in parking throughout the day and night, when weighted over the daytime and nighttime periods, noise generated by parking would be even lower. Thus, vehicle

[53] Kimley-Horn and Associates, Transportation Analysis and Vehicle Miles Traveled Screening, 2024.
[54] According to the Caltrans, Technical Noise Supplement to Traffic Noise Analysis Protocol (September 2013), it takes a doubling of traffic to create a noticeable (i.e., 3 dBA) noise increase.
[55] Replica, Annual Average Daily Traffic, 2022.
[56] The Project anticipates a total of 26 employees with 18 employees available during the day and 8 employees during the night. Thus, the greatest amount of parking activity during the day or night would be 18 vehicles.

access would not significantly impact the Project's contribution to ambient noise levels at the nearby receptors and parking noise impacts would be less than significant.

Composite Noise

Exterior noise levels associated with mechanical equipment, truck loading/trash pickup, and the parking lot would contribute to Project's impact on the surrounding ambient noise levels. However, as described above, noise generated from truck loading/trash pickup and parking lot noise would not reach high levels when weighted over the daytime and nighttime periods. When combined with the Project's mechanical equipment contribution remains unchanged from those shown in **Table 4.13-6**. Therefore, the composite noise levels from the Project (chillers, truck loading, parking lot, and mobile noise) would be below the thresholds and the Project would comply with Chapter 4.50 of the MPMC. Thus, composite noise impacts associated with the operations of the Project would be less than significant.

4.13b Would the project generate excessive groundborne vibration or groundborne noise levels?

Less Than Significant Impact.

Construction

Increases in groundborne vibration levels attributable to the Project would be primarily associated with short-term construction-related activities. Project construction could result in varying degrees of temporary groundborne vibration, depending on the specific construction equipment used and the operations involved. Construction activities could occur as close as 65 feet from the nearest residential buildings. **Table 4.13-7: Typical Construction Equipment Vibration Levels** identifies vibration velocity levels at 25 feet and 65 feet for various types of equipment likely to operate at the Project Site during construction.

Table 4.13-7: Typical Construction Equipment Vibration Levels

Equipment	Peak Particle Velocity at 25 Feet (in/sec)	Peak Particle Velocity at 65 Feet (in/sec)
Vibratory compactor/roller	0.210	0.050
Large Bulldozer	0.089	0.021
Loaded Trucks	0.076	0.018
Small Bulldozer	0.003	0.001
Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, 2018.		

The City has not adopted specific standards for vibration impacts during construction. Therefore, the Caltrans *Transportation and Construction Vibration Guidance Manual (2020)* is used to evaluate construction vibration impacts related to potential building damage. Based on the Caltrans criteria, construction vibration impacts would be significant if vibration levels exceed 0.5 in /sec PPV for building damage; and exceed 0.25 in/sec PPV for human annoyance in structures. As shown in **Table 4.13-7,** the vibration velocities at 65 feet from construction equipment could be up to 0.050 in/sec PPV at the nearest structure. Therefore, construction vibration would be well below and not exceed either the 0.25 in/sec PPV threshold for human annoyance or the 0.5

in /sec PPV for structural damage threshold for older structures. Thus, vibration impacts during Project construction would be less than significant.

Operations

The Project would not generate groundborne vibration during operations that could be felt at surrounding uses. Project operations would not involve railroads or substantial heavy truck operations, and therefore would not result in vibration impacts at surrounding uses. As a result, impacts from vibration associated with Project operation would be less than significant.

4.13c Would the project be located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project expose people residing or working in the project area to excessive noise levels?

No Impact. Refer to Response 4.9e. The nearest airport to the Project Site is the San Gabriel Valley Airport located approximately 5.1 miles northeast of the Project Site. The Project is not within 2 miles of the nearest airport and would not be impacted by airport noise. Additionally, there are no private airstrips located within the Project vicinity. Therefore, the Project would not expose people residing or working in the Project area to excessive airport- or airstrip-related noise levels, and no impact would occur.

4.14 Population and Housing

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?			X	
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?				X

Impact Analysis

4.14a Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less Than Significant Impact. The Project proposes to construct a data center and does not include the construction of residential uses. Project construction would temporarily increase the number of persons present at the Project Site. However, these construction workers would only be present at the Project Site during Project construction. Once operational, the Project would require approximately 26 employees, which are anticipated to be hired from the local population. Should Project-related employees relocate to the area, the local housing stock would be adequate to accommodate the additional workers. The Project would not result in a substantial increase in employment such that population growth could be induced directly or indirectly. Additionally, the Project does not propose the extension of new major infrastructure or uses that would indirectly induce substantial population growth. Therefore, impacts would be less than significant.

4.14b Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

No Impact. There is no housing on the Project Site. Therefore, the Project would not displace existing people or housing, or require construction of replacement housing elsewhere. No impact would occur in this regard.

4.15 Public Services

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physical altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
a) Fire protection?			X	
b) Police protection?			X	
c) Schools?				X
d) Parks?				X
e) Other public facilities?				X

Impact Analysis

4.15a Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physical altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection?

Less Than Significant Impact. The Monterey Park Fire Department (MPFD) provides fire, rescue, and emergency services to the City. The closest fire station is MPFD Station 62 located approximately 0.7-mile west of the Project Site at 2001 Garfield Avenue. Project construction would require temporary lane closures on streets adjacent to the Project Site for utility relocation, delivery of materials, and sidewalk construction. However, Project construction would not require the complete closure of any public streets during construction, and temporary construction activities would not impede the use of the streets for emergencies or access for emergency vehicles. During temporary partial street closure, emergency access and traffic detours would be established in coordination with the City and would conform to City standards. Because the Project would not include housing or other uses that would induce substantial population growth in the area, the Project would not increase demand on fire protection providers such that new facilities are required.

The Project would be designed according to applicable fire code standards and would provide adequate circulation and access to facilitate emergency response during Project operation in accordance with City standards. The Project would provide two new driveways along Saturn Street. One driveway is proposed to be located along the western perimeter of the Project Site, and the other driveway is proposed to be located along the eastern perimeter of the Project Site. These new driveways would be located closer to the western and eastern boundaries of the Project Site compared to the existing driveways. Both driveways would connect to via an internal access lane which would also operate a fire access lane and provide an unobstructed width of 26 feet.

Furthermore, although construction activities would temporarily increase the number of persons present at the Project Site, these workers would only be present at the Project Site during construction of the Project. Once operational, the Project would introduce up to 26 employees. Because the Project would not include housing or other uses that would induce substantial population growth in the area, the Project would not increase demand on fire protection providers such that new facilities are required. Similarly, the Project replaces one commercial building with another commercial building, which would not increase the need for public services to maintain acceptable service ratios or response times. The Project would be designed according to applicable fire code standards and would provide adequate circulation and access to facilitate emergency response during Project operation in accordance with MPFD standards. Diesel transport, fueling, and operations would be subject to compliance with applicable federal, State, and local regulations identified in **Section 4.9: Hazards and Hazardous Materials.** The Project would result in a less than significant impact concerning fire protection services.

4.15b Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physical altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection?

Less Than Significant Impact. The Monterey Park Police Department (MPPD) provides police protection services to the City. The MPPD is approximately 1.4 miles northwest of the Project Site at 320 West Newmark Avenue. As discussed in Response 4.15a, Project construction could encroach on adjacent roadways and temporarily impact street access and traffic flow. However, Project construction would not require the complete closure of any public streets during construction, and temporary construction activities would not impede the use of the streets for emergencies or access for emergency vehicles. During temporary partial street closure, emergency access and traffic detours would be established in coordination with the City.

During operations, the Project would include new security fencing enclosing the Project Site in addition to the existing perimeter fence. Two secured access gates would be provided, one for each proposed driveway. The access gates would remain locked, except during operations and maintenance activities. A pedestrian gate would also be located adjacent to the southern side of the proposed data center building that would provide access to the sidewalk along Saturn Street. The Project would also include security measures such as security lighting, a surveillance camera system, and 24/7 security personnel. The Project would temporarily increase the number of persons present at the Project Site that would only be present during construction activities, and up to 26 employees during operation. Because the Project would not include housing or other uses that would induce substantial population growth in the area, the Project would not increase demand on police protection providers such that new facilities are required. Similarly, the Project replaces one commercial building with another commercial building, which would not increase the need for public services to maintain acceptable service ratios or response times. The City has confirmed that a project of this nature would not be subject to police development impact fees. The Project would result in a less than significant impact concerning police protection services.

4.15c Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physical altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for schools?

No Impact. The Project would not include any residential uses. As mentioned, the Project would not induce population growth and thus would not increase the demand for school services. The Project would not require new or physically altered school facilities, therefore, would not result in adverse physical impacts in this regard. The Project would result in no impact concerning school facilities.

4.15d Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physical altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for parks?

No Impact. See Response 4.16 below.

4.15e Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physical altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for other public facilities?

No Impact. Other public facilities such as libraries and hospitals are typically provided to serve residents within the City. Given the Project has no residential component, Project implementation would not increase demand for other public facilities such as libraries and hospitals. Therefore, the Project would not require new or physically altered public facilities such as libraries and hospitals and therefore would not result in adverse physical impacts in this regard. The Project would result in no impact concerning public facilities.

4.16 Recreation

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?				X
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?				X

Impact Analysis

4.16a Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

4.16b Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

No Impact. The recreational facility nearest the Project Site is La Loma Park located approximately 135 feet northwest from the Project Site. Because the Project would not include housing or other uses that would induce substantial population growth in the area, the Project is not anticipated to increase the demand for existing recreational facilities or generate a demand for new ones. The limited number of employees during operation of the Project would not materially increase use of local recreation facilities. Further, Project implementation is not anticipated to increase the use of existing recreational facilities such that substantial physical deterioration of a facility would occur or be accelerated. The Project does not propose or require new or physically altered recreational facilities and therefore would not result in adverse physical impacts in this regard. No impact would occur.

4.17 Transportation

This Section is based on the *Transportation Analysis and Vehicle Miles Traveled Screening Memorandum* (Kimley-Horn, April 2024), which is included in **Appendix K: Transportation Analysis and Vehicle Miles Traveled Screening Memorandum.**

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Conflict with a program plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycles, and pedestrian facilities?				X
b) Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?			X	
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (for example, farm equipment)?			X	
d) Result in inadequate emergency access?			X	

Impact Analysis

4.17a Would the project conflict with a program plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

No Impact. Regional access to the Project Site would be provided via SR 60, I-10, SR 164, and I-710, located approximately 0.4-mile south, 2.1 miles north, 2.8 miles east, 3.1 miles west of the Project Site, respectively. Local access to the Project Site is provided via Saturn Street to the south.

Local bus service is provided by the Monterey Park Spirit Bus Route 5 on Saturn Street. There are no designated bicycle paths within the vicinity of the Project Site, and the Project would not preclude implementation of any bike routes identified in the City Circulation Element of the General Plan. Pedestrian access, which would remain upon buildout, is provided via an existing sidewalk along the portion of Saturn Street that abuts the southeastern portion of the existing commercial office building. The Project would enhance walkability by constructing new pedestrian sidewalk areas along the Project Site frontage. Pedestrian access within the Project Site would also be provided via a walkway along the western, southern, and eastern sides of the data center. A pedestrian gate with sidewalk connection to the public right-of-way would be provided on Saturn Street west of the new eastern driveway.

The proposed Project would not conflict with any adopted policies, plans, or programs regarding alternative transportation because no changes to existing transportation policies, plans, or programs would result from Project implementation. Therefore, the Project would result in no impact in this regard.

4.17b Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

Less Than Significant Impact. CEQA Guidelines Section 15064.3 codifies the change from level of service to VMT as a metric for transportation impact analysis. Pursuant to SB 743, VMT analysis is the primary method for determining CEQA impacts. According to CEQA Guidelines Section 15064.3(a), VMT refers to the amount and distance of automobile travel attributable to a project. The City adopted their Transportation Study Guidelines for Vehicle Miles Traveled and Level of Service Assessment (Transportation Study Guidelines) (September 2020) to provide transportation analysis requirements for land development, roadway projects, and specific plans in the City. As stated within the Transportation Study Guidelines, there are three types of screening that may be applied to effectively screen projects from project-level assessment. A project may be screened out of VMT analysis if it meets one or more of the following screening steps: (1) Transit Priority Area (TPA) Screening; (2) Low VMT Area Screening; or (3) Project Type Screening.

As shown in **Appendix K**, there will be 26 employees at the building throughout the day, with 18 employees available during the day and 8 employees available during the night. The 26 employees at the Project per day equates to a total of 52 daily vehicle trips. The Project itself is not an employee-intensive use and therefore does not generate a material number of daily vehicle trips or VMT. The 26 employees at the Project per day equates to a total of 52 daily vehicle trips, which is far less than the 110 daily vehicle trips threshold set forth in the Transportation Study Guidelines for project-type screening analysis. As such, the Project would meet one of the screening criteria identified in the City's Transportation Study Guidelines. Therefore, the Project is presumed to have a less-than-significant transportation impact and qualifies for being screened out from further VMT analysis. Impacts would be less than significant.

4.17c Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less Than Significant Impact. Vehicular access is currently provided via two driveways off Saturn Street, one each off the eastern and western boundaries of the Project Site. Vehicular access to the Project Site would be provided via two new gated driveways located along Saturn Street. One driveway is proposed to be located along the western perimeter of the Project Site, and the other driveway is proposed to be located along the eastern perimeter of the Project Site. These new driveways would be located closer to the western and eastern boundaries of the Project Site compared to the existing driveways. These two driveways would connect with each other along the northern side of the proposed equipment yard. The driveway along the eastern perimeter of the Project Site would serve as the main entry to the Project Site for passenger and service vehicles. Additionally, an internal, 26-foot-wide drive aisle would be included for general circulation and fire access. The designs and dimensions of the driveways would be designed to comply with the City's current design requirements. The Project would not have the potential to increase hazards due to geometric design. Thus, the Project does not propose any improvements

with potential to increase hazards due to incompatible uses. The Project would result in a less than significant impact in this regard.

4.17d Would the project result in inadequate emergency access?

Less Than Significant Impact. See Response 4.9f.

4.18 Tribal Cultural Resources

This Section is based on AB 52 communications initiated by the City; see **Appendix L: Assembly Bill 52 Communications**.

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is				
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k); or		X		
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.		X		

Impact Analysis

4.18a.i Would the project cause a substantial adverse change in the significance of a tribal cultural resource, listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?

4.18a.ii Would the project cause a substantial adverse change in the significance of a tribal cultural resource- a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Less Than Significant With Mitigation Incorporated. Chapter 532 Statutes of 2014 (i.e., Assembly Bill 52 (AB 52)) requires that lead agencies evaluate a project's potential impact on "tribal cultural resources," which include "[s]ites, features, places, cultural landscapes, sacred places, and

objects with cultural value to a California Native American tribe that are eligible for inclusion in the California Register of Historical Resources or included in a local register of historical resources." AB 52 also gives lead agencies the discretion to determine, based on substantial evidence, whether a resource qualifies as a "tribal cultural resource." In compliance with PRC Section 21080.3.1(b), the City provided formal notification to California Native American tribal representatives identified by the California NAHC. Results of the Sacred Lands File Search conducted with the NAHC were positive, and the NAHC recommended further consultation with the Gabrieleno Band of Mission Indians-Kizh Nation in accordance with AB 52.

The City contacted the tribal representative of the tribe noted below pursuant to AB 52 requirements. Correspondence to and from the tribal representative is included in **Appendix L**.

- **Fernandeño Tataviam Band of Mission Indians**, Sarah Brunzell
- **Gabrieleno Band of Mission Indians-Kizh Nation**, Andrew Salas
- **Gabrieleno/Tongva San Gabriel Band of Mission Indians**, Anthony Morales
- **Gabrielino/Tongva Nation**, Sandonne Goad
- **Gabrielino Tongva Indians of California Tribal Council**, Robert Dorame
- **Gabrielino Tongva Indians of California Tribal Council**, Christina Conley
- **Gabrielino-Tongva Tribe**, Charles Alvarez
- **Santa Rosa Band of Cahuilla Indians**, Lovina Redner
- **Soboba Band of Luiseno Indians**, Joseph Ontieros
- **Soboba Band of Luiseno Indians**, Isaiah Vivanco

The City received a response from the Fernandeño Tataviam Band of Mission Indians on June 10, 2024 stating that they would not be requesting consultation pursuant to AB 52 for the Project. To date, no other responses from the Native American Tribes have been received as part of the AB 52 tribal consultation effort.

As discussed in Response 4.5b, an on-site pedestrian survey conducted in February 2024 did not identify artifacts or potential for significant buried remains. No other cultural resources (including prehistoric or historic archaeological or historic architectural resources) were identified during the field survey. Disturbances associated with previous excavation and construction of the existing commercial office building at the Project Site have been severe and have disrupted soil beyond depths at which buried cultural resources are likely. Therefore, the potential to encounter in-situ remains associated with significant archaeological materials during Project activities is low. Nevertheless, ground-disturbing activities have the potential to reveal buried deposits not observed on the surface during previous surveys. Therefore, the potential exists for the Project to result in a substantial adverse change in the significance of a previously unidentified Native American tribal cultural resource. With implementation of **MM TCR-1** through **MM TCR-3**, potential impacts to tribal cultural resources would be less than significant.

Mitigation Measures

MM TCR-1 The Project Applicant must retain a professional Native American monitor from or approved by a consulting Tribe. The monitor will be present during construction excavations such as clearing/grubbing, grading, trenching, or any other construction excavation activity associated with the Project. If cultural resources are encountered, the Native American monitor will have the authority to request ground disturbing activities cease within 50-feet of discovery to assess and document potential finds in real time. Monitoring activities will cease when potential for significant buried resources have been exhausted (e.g., at the completion of construction excavation activity), as determined by the Qualified Archaeologist and in consultation with the Native American monitor. The Native American monitor and archaeological monitor will be present during construction excavation activity. Personnel needs would be determined during a pre-construction meeting.

MM TCR-2 If significant Pre-Contact (predating Native American contact with Europeans) and/or Post-Contact (postdating Native American contact with Europeans) cultural resources are discovered and avoidance cannot be ensured, the qualified archaeologist must develop a treatment plan, the drafts of which will be provided to the City for review and approval, as detailed within MM CUL-1.

MM TCR-3 The Applicant must, in good faith, consult with the Tribe or Tribal Government that requested consultation under AB 52 retained Native American monitor on the disposition and treatment of any artifacts or other cultural materials if encountered during the Project grading.

4.19 Utilities and Service Systems

This Section is based on the *Water and Sewer Infrastructure Report* (Fuscoe Engineering, Inc., May 2024), which is included in its entirety in **Appendix M-1: Water and Sewer Infrastructure Report** and **Appendix M-2: Water Efficiency Memorandum.**

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
a) Require or result in the relocation or construction of new or expanded facilities concerning the following, the construction or relocation of which could cause significant environmental effects? i. Water, ii. Wastewater, iii. Wastewater Treatment, iv. Stormwater Drainage, v. Electric Power, Natural Gas, and Telecommunications.			X	
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?			X	
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project projected demand in addition to the provider's existing commitments?			X	
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?			X	
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?			X	

Impact Analysis

4.19a.i Would the project require or result in the relocation or construction of new or expanded facilities concerning water, the construction or relocation of which could cause significant environmental effects?

Less Than Significant Impact. The City of Monterey Park Public Works Department, Engineering Division owns and maintains all water infrastructure within the City, including on-site and off-site facilities. The Project Site is currently served by an existing 12-inch water main running south on Orange Avenue to Saturn Street and an existing 12-inch water main running west on Saturn Street

to Atlas Avenue/Portrero Grande Drive. There is also an existing 8-inch water line running east from the intersection of Orange Avenue and Saturn Street to Potrero Grande Drive.

The City also owns and maintains on-site water infrastructure within an easement. There is an existing City-owned 12-inch water line on-site starting at the southerly drive entry and running north through the northern property line. There is also an existing City-owned 8-inch water line that tees off the existing 12-inch line and runs east through the Project Site and then southeasterly through the northerly drive entry to connect back with the 12-inch line in Saturn Street.

There are also currently three public on-site fire hydrants within an easement, and four public off-site fire hydrants surrounding the Project Site. All on-site and off-site hydrants are owned and maintained by the City.

During construction, water will be required intermittently for dust control, equipment cleaning, soil grading and preparation during the early phases of the Project. The latter phases of construction normally require less water usage. Since water usage during construction is typically less demanding than the water usage for the proposed Project, it is anticipated that existing water infrastructure would meet the limited, temporary water demand associated with construction of the Project, and that the water purveyor is able to provide water during construction.

It is anticipated that the Project may require construction of new lateral connections (services) to existing water lines and/or relocation of the existing 8-inch waterline within the site. Construction impacts associated with the installation of water services would primarily involve trenching in order to place the lines sufficiently below the ground surface. When considering impacts resulting from the installation of any required water infrastructure, all impacts are of a relatively short-term duration (i.e., weeks to months) and would cease to occur once the installation is complete. Installation of new or relocation of existing water infrastructure will be limited to on-site water distribution, and minor off-site work associated with connections to the public main. No upgrades to public water mains, other than onsite infrastructure, are anticipated. Before ground disturbance, Project contractors would coordinate with the City to identify the locations and depth of all lines.

Table 4.19-1: Estimated Existing Water Demand shows the estimated existing water demand for the Project Site. The existing water demand assumes 120 percent of the Los Angeles County Sanitation Districts (LACSD) wastewater generation factors. This estimate is appropriate to account for any additional water demand for possible minor losses on-site, such as water use due to human consumption (cooking, drinking, watering indoor plants, evaporation), that would deviate from the LACSD sewage generation factors. The Estimated Total Water Usage (ETWU) equation is used for landscaping which is assumed to be 30 percent of the Project Site. The ETWU calculation for landscaping is included in the Water and Sewer Infrastructure Report.

Table 4.19-1: Estimated Existing Water Demand			
Land Use	**Square Footage (SF)**	**Estimated Average Daily Sewage Flow Factor (gal/1,000 SF gross area)[1]**	**Total Water Demand (gpd)**
Building 1 (2-story; office)	41,100	240	9,864
Building 1 (2-story; utility)	164,528	30	4,936
Building 2 (utility)	3,936	30	118
Landscaping[2]	206,867	ETWU Method	14,151
Total Existing Water Demand to be Removed			**29,069**

gal = gallon, SF = square foot, gpd = gallons per day
1. Based on 120 percent of the sewer generation factors from the "Loading for each class of land use" from LACSD.
2. Demand based on ETWU equation: (Eto*plant factor*landscaped area* 0.62)/irrigation efficiency. Utilizing CIMIS Reference Evapotranspiration Zones Map ET of 46.6 in/yr, and a conservative plant factor of 0.7 and irrigation efficiency of 0.81 proposed condition.

Source: Fuscoe Engineering, Water and Sewer Infrastructure Report, 2024.

Table 4.19-2: Estimated Proposed Water Demand shows the Project's estimated proposed water demand. Similar to how existing water demand was calculated, the Project's estimated proposed water demand was also calculated using 120 percent of LACSD wastewater generation factors as well as the ETWU equation for proposed landscaping. Proposed landscaping was assumed to comprise 30 percent of the Project Site (similar to existing conditions). As shown below in **Table 4.19-2**, the Project's estimated water consumption is approximately 33,031 gpd, resulting in a net increase of approximately 3,962 gpd compared to existing conditions.

Table 4.19-2: Estimated Proposed Water Demand			
Land Use	**Square Footage (SF)**	**Average Generation Factor (gpd/1,000 SF)[1]**	**Total Water Demand (gpd)**
Data Hall Center[2]	109,970	30	3,299
Office (Network)[3]	1,750	240	420
Office (Support)[3]	26,700	240	6,408
Office (Circulation)[3]	16,542	240	3,970
Ancillary (Elec.)[2]	23,976	30	719
Ancillary (Mech.)[2]	39,463	30	1,184
Substation (Service)	24,000	120	2,880
Landscaping[3]	206,867	ETWU Method	14,151
Total Proposed Water Demand			**33,031**
Total Existing Water Demand to be Removed			29,069
Project Net Water Demand			**3,962**

gpd = gallons per day, SF = square foot
1. Based on 120 percent of the sewer generation factors from the "Loading for each class of land use" from LACSD.
2. Assumes 'Warehouse' will be used for Data Hall Center, Mechanical Area, Electrical Area from LACSD. The Applicant's mechanical, electrical, and plumbing (MEP) engineer estimated the data hall center would have a baseline (using standard efficiency fixtures) water demand of approximately 75,340 gallons per year (gpy) (207 gpd). The design case (progressive

fixtures) water demand would be approximately 45,180 gpy (124 gpd). Therefore, the estimate provided based on LACSD (3,299 gpd for the data hall center) is conservative. See also **Appendix M-2: Water Efficiency Memorandum.**
3. Assumes 'Office Building' will be used for Office areas.
4. Assumes 'Service Station' will be used for Electrical Substation.
5. Demand based on Estimated Total Water Use equation: (Eto*plant factor*landscaped area* 0.62)/irrigation efficiency. Utilizing CIMIS Reference Evapotranspiration Zones Map ET of 46.6 in/yr, and a conservative plant factor of 0.7 and irrigation efficiency of 0.81 proposed condition.

Source: Fuscoe Engineering, Water and Sewer Infrastructure Report, 2024.

According to the Water and Sewer Infrastructure Assessment Report, when analyzing for infrastructure capacity, the projected demands for both fire suppression and domestic water are considered. Although domestic water demand is the Project's main contributor to water consumption, fire flow demands have a much greater instantaneous impact on infrastructure. Based on an analysis of the Project Site's fire demands and review of the resulting residual pressures from the Tait Assessment of Water Availability (included as Attachment C in the Water and Sewer Infrastructure Report), it has been determined that the existing water system at the Project Site is more than adequate to handle the demands for fire suppression. Furthermore, the relocation for the existing 8-inch water line within the Project Site is nearly negligible in terms of system pressure loss and will not adversely affect the public water system. Adequate fire flows can be provided to the Project by the existing and rerouted water infrastructure.

For the reasons listed above, the Project would not require or result in the relocation or construction of new or expanded water facilities. Impacts would be less than significant, and no mitigation is required.

4.19a.ii Would the project require or result in the relocation or construction of new or expanded facilities concerning wastewater, the construction or relocation of which could cause significant environmental effects?

4.19a.iii Would the project require or result in the relocation or construction of new or expanded facilities concerning wastewater treatment, the construction or relocation of which could cause significant environmental effects?

Less Than Significant Impact. The City is within the jurisdictional boundaries of Sanitation Districts of Los Angeles County Sanitation District (LACSD) No. 2. Wastewater generated by the Project would be conveyed to existing City-owned sewer lines located in Saturn Street via proposed lateral sewer connections, which would then tie into one of LACSD's regional trunk sewers crossing through LACSD. Wastewater from the Project Site would be treated at the A.K. Warren Water Resource Facility (Warren Facility) in the City of Carson. The Warren Facility, owned and operated by LACSD, currently provides primary and secondary treatment for a design capacity of 400 million gallons of wastewater per day (mgd), and an average flow of approximately 237 mgd.

Construction activities for the Project could result in temporary wastewater generation on-site. However, such generation would be temporary when compared with the wastewater generated by the Project. In addition, construction workers would typically utilize portable restrooms and hand wash areas, which would not contribute to direct wastewater flows to the City's wastewater

system. Thus, wastewater generation from Project construction activities is not anticipated to cause any measurable increase in wastewater flows.

Construction impacts associated with wastewater infrastructure would primarily be confined to trenching for miscellaneous utility lines and connections to public infrastructure. Installation of wastewater infrastructure will be limited to on-site wastewater distribution and minor off-site work associated with lateral connections to the existing City sewer main. Any work that may affect services to the existing sewer lines or impacts to LACSD facilities or plant will be coordinated with the City's Public Works Department, Engineering Division. Furthermore, construction management and access plans would ensure safe pedestrian access as well as emergency vehicle access and safe vehicle travel. Moreover, when considering impacts resulting from the installation of any required wastewater infrastructure, all impacts are of a relatively short-term duration and would cease to occur once the installation is complete.

Table 4.19-3: Estimated Existing Wastewater Generation shows the estimated existing wastewater generation for the Project Site, based on existing Project Site conditions and using LACSD wastewater generation factors.

Table 4.19-3: Estimated Existing Wastewater Generation

Land Use	Square Footage (SF)	Estimated Average Daily Sewage Flow Factor (gal/1,000 SF gross area)	Total Wastewater Generation (gpd)
Building 1 (2-story; office)	41,100	200	8,220
Building 1 (2-story; utility)	164,528	25	4,113
Building 2 (utility)	3,936	25	98
Total	**209,564**		**12,432**

gal = gallon, SF = square foot, gpd = gallons per day
Source: Fuscoe Engineering, Water and Sewer Infrastructure Report, 2024.

As shown in **Table 4.19-4: Estimated Proposed Wastewater Generation**, consistent with the proposed uses and LACSD's generation factors, the Project's projected wastewater generation is approximately 15,734 gpd, representing a net increase in wastewater generation at the Project Site of approximately 3,302 gpd.

Table 4.19-4: Estimated Proposed Wastewater Generation

Land Use	Square Footage (SF)	Average Generation Factor (gpd/1,000 SF)[1]	Total Wastewater Generation (gpd)
Data Hall Center[2]	109,970	25	2,749
Office (Network)[3]	1,750	200	350
Office (Support)[3]	26,700	200	5,340
Office (Circulation)[3]	16,542	200	3,308
Ancillary (Elec.)[2]	23,976	25	599
Ancillary (Mech.)[2]	39,463	25	987
Substation (Service)	24,000	100	2,400
Total Proposed Wastewater Flow			**15,734**
Total Existing Wastewater Flow to be Removed			12,432
Project Net Wastewater Flow			**3,302**

gpd = gallons per day, SF = square foot

1. Based on 100 percent of the sewer generation factors from the "Loading for each class of land use" from LACSD.
2. Assumes 'Warehouse' will be used for Data Hall Center, Mechanical Area, Electrical Area from LACSD.
3. Assumes 'Office Building' will be used for Office areas.
4. Assumes 'Service Station' will be used for Electrical Substation.

Source: Fuscoe Engineering, Water and Sewer Infrastructure Report, 2024.

A flowrate of 15,734 gpd is equivalent to 11 gallons per minute (gpm). Wastewater generated by the Project would drain into the existing 8-inch sewer line in Saturn Street, which has a sewer flow capacity of approximately 225 gpm at a slope of 1 percent with 50 percent filled capacity. The flow-depth of the existing 8-inch sewer has been evaluated and confirmed that there is capacity in the existing adjacent sewer system to convey the wastewater flows that would be generated by the Project. See Attachment F of **Appendix M-1.**

Additionally, a will-serve letter has been received from LACSD, confirming that LACSD has the capacity to accommodate the Project's estimated wastewater generation increase; see Attachment A of **Appendix M-1.** Furthermore, the Project's estimated wastewater generation of 3,302 gpd or 0.004 mgd comprises less than 0.002 percent of the wastewater that is processed daily at the Warren Facility.

For the reasons substantiated above, the Project would not require or result in the relocation or construction of new or expanded wastewater and wastewater treatment facilities. Impacts would be less than significant.

4.19a.iv Would the project require or result in the relocation or construction of new or expanded facilities concerning stormwater drainage, the construction or relocation of which could cause significant environmental effects?

Less Than Significant Impact. Refer to Response 4.10c concerning drainage patterns and stormwater drainage systems. As discussed in Response 4.10c, all proposed drainage improvements would be located within the Project Site. The Project would not require or result in the relocation or construction of new or expanded off-site stormwater facilities, the construction or relocation of which could cause significant environmental effects. Therefore, the Project would result in a less than significant impact in this regard.

4.19a.v Would the project require or result in the relocation or construction of new or expanded facilities concerning electric power, natural gas, and telecommunications, the construction or relocation of which could cause significant environmental effects?

Less Than Significant Impact. The City's electrical power is provided by SCE, and natural gas is provided by SoCalGas. The City's telecommunications are provided by various companies. SCE, SoCalGas, and local telecommunications companies operate and maintain transmission and distribution infrastructure throughout the City. Refer to Responses 4.6a and 4.6b for further discussions concerning electricity. The Project would not include any natural gas usage; therefore, the Project would not result in an impact on natural gas. The Project would include on-site connections to existing telecommunication services. The Project would not require or result in the relocation or construction of new or expanded off-site electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant

environmental effects. Therefore, the Project would result in a less than significant impact in this regard.

4.19b Would the project have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years?

Less Than Significant Impact. The City of Monterey Park 2020 Urban Water Management Plan (UWMP) projects water demands to increase from 8,671 acre-feet per year (AFY) in 2025 to 9,066 AFY in 2045 for dry years representing an increase in demand of 395 AFY and 8,421 acre-feet per year (AFY) in 2025 to 8,804 AFY in 2045 for normal years representing an increase in demand of 383 AFY. The proposed increase in demand from the Project of 3,962 gpd (4 AFY) represents approximately 1 percent of the total increase in demand from 2025 to 2045 in the UWMP. In addition, the volume of water supply required for the Project does not trigger the requirements for a water supply assessment pursuant to either SB 610 or SB 221. The UWMP also projects adequate supplies to meet all future demands. Therefore, the City would have sufficient water supplies available to serve the Project, and impacts would be less than significant.

4.19c Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project projected demand in addition to the provider's existing commitments?

Less Than Significant Impact. As demonstrated in Sections 4.19a.ii and Sections 4.19a.iii, there is existing treatment capacity in the region for estimated Project wastewater generation. Project development would not impact LACSD wastewater treatment facility capacity. The Project would not require or result in the relocation or construction of new or expanded off-site sewer facilities, the construction or relocation of which could cause significant environmental effects. Therefore, the Project would result in a less than significant impact in this regard.

4.19d Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

4.19e Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less Than Significant Impact. Athens Services waste haulers provide services in the City, including the Project Site. The City primarily disposes at landfills throughout Los Angeles County. Project construction would result in generation of construction and demolition (C&D) debris such as metal scrap, lumber, concrete which will be collected and diverted to a C&D debris facility for materials to be recycled and/or discarded. As shown in **Table 4.19-5: Estimated Solid Waste Generation**, C&D of the Project is estimated to generate approximately 10,127 tons of C&D debris. This estimation is a conservative estimate as it assumes that no reductions in waste generation would occur due to recycling.

Table 4.19-5: Estimated Solid Waste Generation				
Land Use	**Size**	**Waste Generation Rate**	**Waste Generated (tons)**	**Waste Generated (lbs)**
Demolition[1]				
Office	209.564 ksf	46 tons/ksf	9,640 tons	19,279,888 lbs
Construction[2]				
Data Center	218.4 ksf	4,020 lb/ksf	439 tons	877,968 lbs
Substation	24 ksf	4,020 lb/ksf	48 tons	96,480 lbs
Total Demolition and Construction Waste			*10,127 tons*	*20,254,336 lbs*
Operations[3]				
Data Center[4]	26 employees	13.82 lb/employees/day	0.18 tons	359 lbs
Total Operational Waste			*0.18 tpd*	*359 lbs/day*

ksf = thousand square feet; lbs = pounds; tpd = tons per day

1. The demolition waste generation rate of 46 tons/ksf is based on the CalEEMod User Guide Appendix A, page 13.
2. The construction waste generation rate of 4,020 lb/ksf is based on the U.S.EPA, Characterization of Building-Related Construction and Demolition Debris in the United States, Table A-2, June 1998.
3. Generation factors provided by the CalRecycle website, refer to Estimated Solid Waste Generation Rates, https://www2.calrecycle.ca.gov/WasteCharacterization/General/Rates. Accessed March 27, 2024.
4. Assumes "Warehouse" will be used for proposed data center.

Residual wastes such as trash packing materials, and plastics could require disposal at landfill. Disposal and recycling of the construction debris would be required to comply with all federal, State, and local regulations. All construction activities would be subject to conformance with relevant Federal, State, and local requirements related to solid waste disposal. The Project would be required to comply with the California Integrated Waste Management Act of 1989 (AB 939), which requires that at least 50 percent of waste produced is recycled, reduced, or composted and is included in MPMC Chapter 6.08, Solid Waste, Recyclables, and Construction and Demolition Debris, which would achieve compliance with State law.

As detailed in **Table 4.19-5**, Project operations would generate approximately 0.18 tons per day (tpd). The estimated amount of solid waste is conservative because the waste generation factors do not account for recycling or other diversion measures. The annual amount of solid waste generated by the Project would represent a minor amount of the estimated 137 million tons of remaining disposal capacity at the County's Class III landfills.[57] As such, the solid waste generated by the Project would be accommodated by the landfills that serve the Project Site.

During operation, the Project would be required to comply with CalRecycle's waste diversion rate target of 50 percent of the waste stream. The Project would also be subject to AB 1826, which requires businesses to provide separate recycling bins for organic waste. Therefore, the Project would be subject to compliance with the CALGreen Code, State regulations, and City regulations regarding solid waste management and reduction. Impacts would be less than significant.

[57] Los Angeles County Department of Public Works, Countywide Integrated Waste Management Plan: 2021 Annual Report, December 2022, https://dpw.lacounty.gov/epd/swims/ShowDoc.aspx?id=17450&hp=yes&type=PDF. Accessed March 18, 2024.

4.20 Wildfire

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?				X
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?				X
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?				X
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?				X

Impact Analysis

4.20a *If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project substantially impair an adopted emergency response plan or emergency evacuation plan?*

4.20b *If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project, due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?*

4.20c *If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?*

4.20d *If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?*

No Impact. See Response 4.9f. According to CAL FIRE, the Project Site is not within or near a SRA or a VHFHSZ.[58] The nearest VHFHSZ is located approximately 4 miles northwest of the Project Site. The Project Site is relatively flat and developed with urban uses (except for the grass lot and limited landscaped area bordering the northern boundary of the Project Site), which precludes factors such as slopes or strong winds from exacerbating fire risk. The Project is located on an existing developed site and would connect to existing utilities and would not require the installation or maintenance of infrastructure that may exacerbate fire risk. Post-fire impacts such as drainage changes and landslides would not occur as the Project Site and its surroundings are highly urbanized and mostly flat and not have any steep slopes or hillsides that would be susceptible to landslides or flooding. Therefore, the Project would result in no impact.

[58] California Department of Forestry and Fire Protection. FHSZ Viewer, https://egis.fire.ca.gov/FHSZ/. Accessed February 5, 2024.

4.21 Mandatory Findings of Significance

Environmental Issue	Potentially Significant Impact	Less Than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
Does the Project:				
a) Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?		X		
b) Have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of the past projects, the effects of other current projects, and the effects of probable future projects.)			X	
c) Have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?			X	

Impact Analysis

4.21a Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Less Than Significant With Mitigation Incorporated. As discussed throughout this IS/MND, the Project does not have the potential to degrade the environment's quality or result in significant environmental impacts that cannot be reduced to less than significant following compliance with the established regulatory framework (i.e., federal, State, and local regulations) and the recommended mitigation measures.

As concluded in **Section 4.4: Biological Resources**, the Project would not reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, or reduce the number or restrict the range of a rare or endangered plant or animal.

As concluded in **Section 4.5: Cultural Resources**, the Project would not eliminate important examples of the major periods of California history. The Project was assessed to have low

sensitivity for prehistoric resources and buried historic archaeological resources. Following implementation of **MM CUL-1**, potential impacts to archaeological resources would be reduced to less than significant.

As concluded in **Section 4.18: Tribal Cultural Resources**, the Project could cause an adverse change in the significance of a tribal cultural resource, unless mitigated. Following implementation of **MM TCR-1** through **MM TCR-3**, potential impacts to tribal cultural resources would be reduced to less than significant.

4.21b Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of the past projects, the effects of other current projects, and the effects of probable future projects.)

Less Than Significant Impact. The proposed Project would result in significant impacts unless mitigated for the following environmental resource areas: cultural resources, geology and soils, hazards and hazardous materials, noise and vibration, and tribal cultural resources. The potential impacts associated with these resource areas are localized, thus, would not result in cumulative impacts. Other development projects within the City would be subject to the City's discretionary review process, CEQA, and the established regulatory framework, which would be evaluated on a case-by-case basis.

For all other resources areas, the analysis determined the Project would result in either no impact or a less than significant impact following compliance with the established regulatory framework, without the need for mitigation. Project impacts would not be cumulatively considerable.

Based on correspondence with the City on March 14, 2024, there are no anticipated cumulative projects anticipated in a 0.5-mile radius of the Project Site. Additionally, Project impacts would be less than significant or less than significant with mitigation incorporated. Therefore, the proposed Project would not result in any cumulatively considerable impacts, and no mitigation is required.

4.21c Does the project have environmental effects which will cause substantial adverse effects on human beings, directly or indirectly?

Less Than Significant Impact. As discussed in the respective sections, the Project would have no potentially significant impacts that would not be reduced to less than significant following compliance with the established regulatory framework and/or recommended mitigation measures. The Project would not cause substantial adverse effects on human beings directly or indirectly. Therefore, impacts concerning adverse effects on human beings would be less than significant.

Air Quality Analysis Memorandum

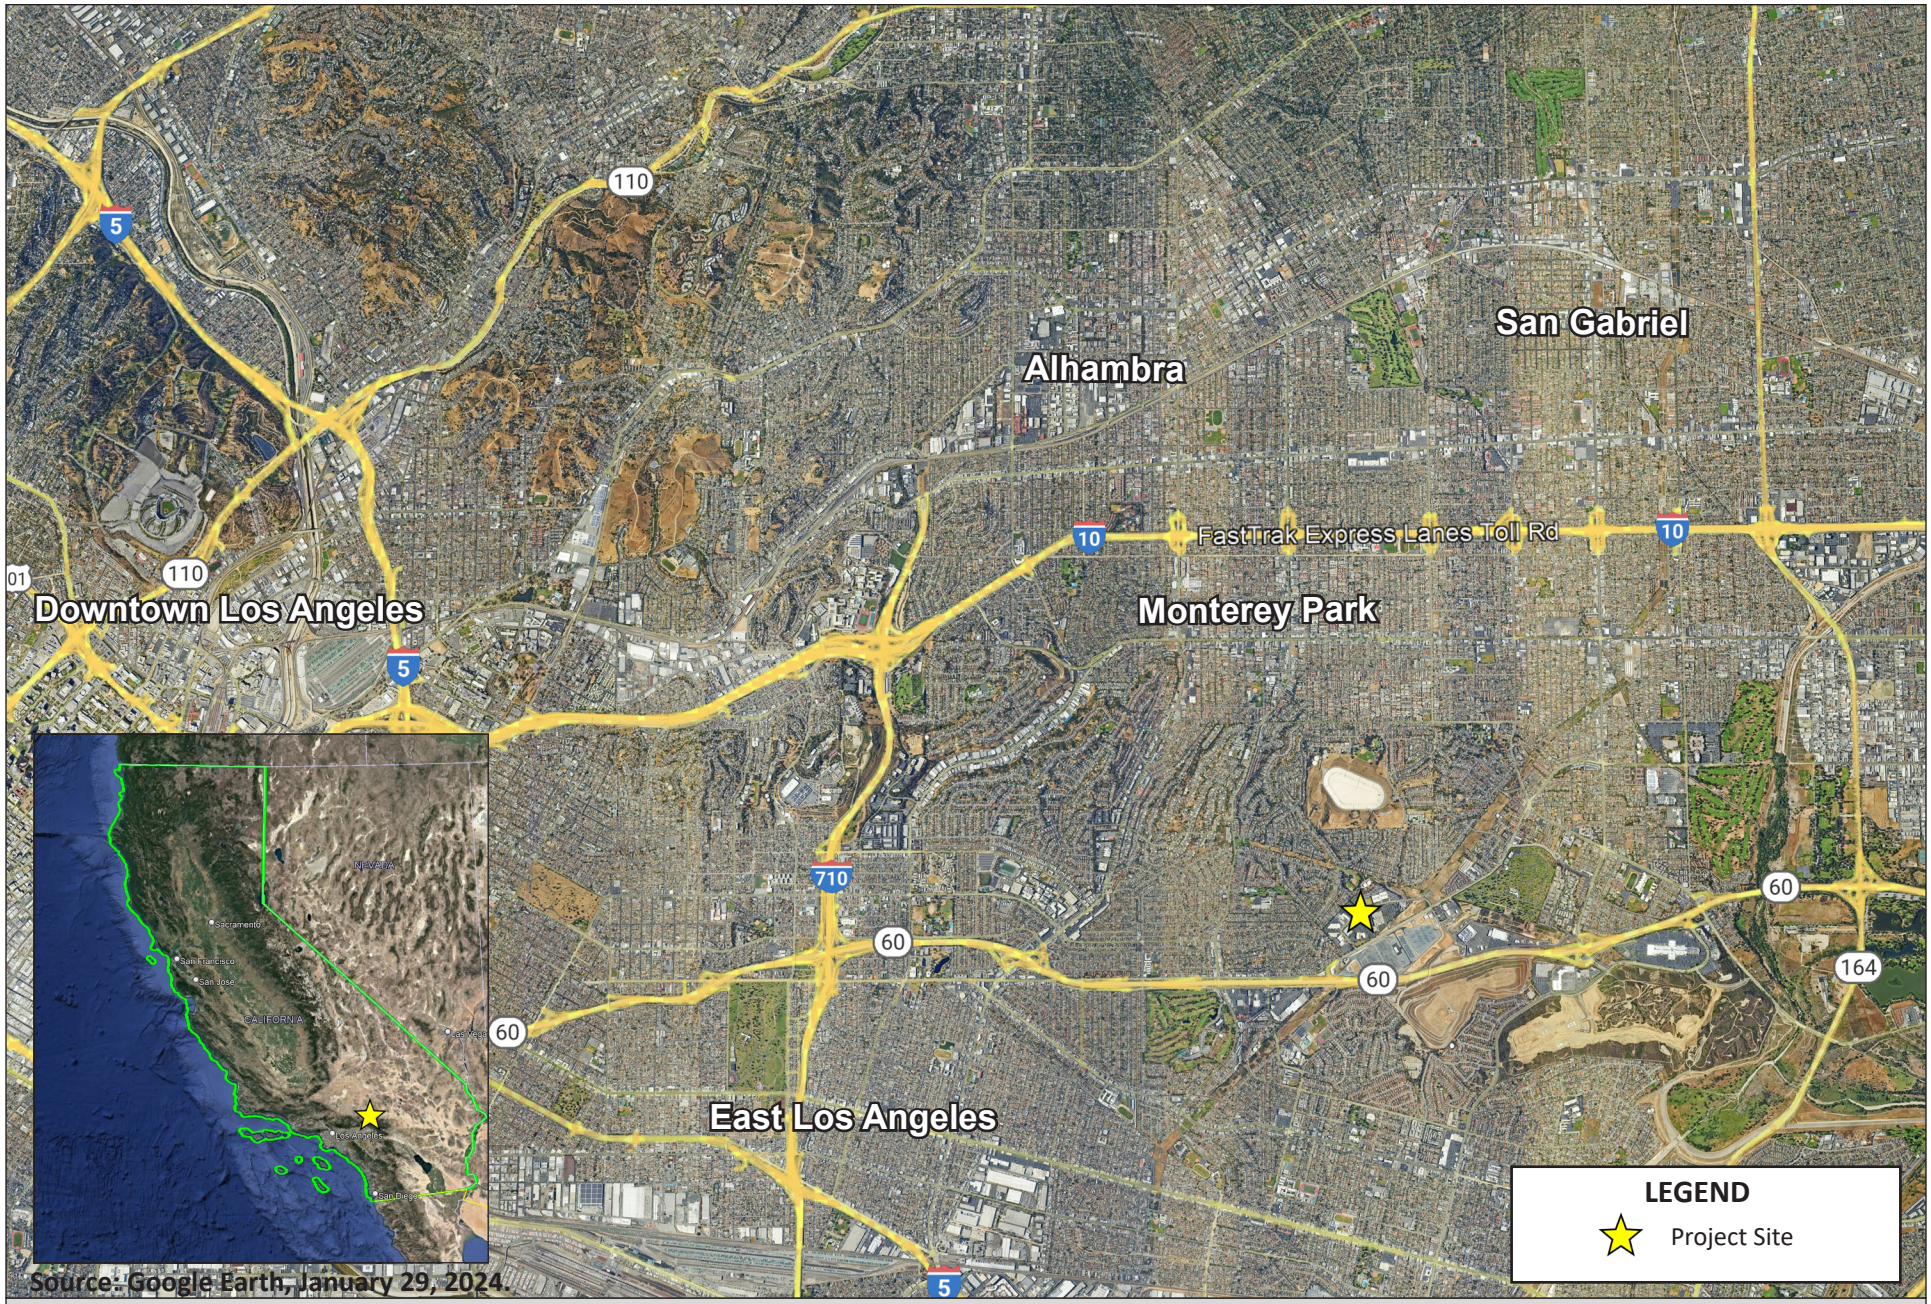
Kimley»Horn

Kimley»Horn

MEMORANDUM

To:	Bryan Marsh, CEO, SDCF Monterey Park, LLC
From:	Noemi Wyss, AICP, Kimley-Horn and Associates, Inc.
Date:	August 28, 2024
Subject:	1977 Saturn Data Center Project – Air Quality Analysis

1.0 Purpose



The purpose of this memorandum is to assess potential impacts due to air pollutant emissions associated with construction and operation of the 1977 Saturn Data Center Project (Project), proposed to be located in the City of Monterey Park (City), California.

2.0 Proposed Project Description

The Project would be located on an approximately 15.8-acre site (Project Site) at 1977 Saturn Street; see **Figure 1: Regional Vicinity Map**. The Project Site is bound by residences, a park, a commercial nursery, and water towers to the north, open space to the east, office uses to the south, and office uses and single-family residences to the west; see **Figure 2: Local Vicinity Map**. The Project Site is currently improved with a two-story commercial office building that is currently vacant, an ancillary one-story building.

The Project would demolish and remove the existing improvements and construct a state of the art data center including approximately 218,400 square feet that would include approximately 109,970 square feet of data hall space and approximately 91,889 square feet of support space, which would consist of offices and meeting rooms, employee amenities (such as restrooms, break room, etc.), truck loading and unloading areas, storage areas, mechanical/electrical/fiber entry rooms, and other ancillary uses. See **Figure 3: Conceptual Site Plan**.

A total of sixty-eight (68) parking spaces would be provided adjacent to the northern and eastern side of the proposed data center building, including three handicapped accessible spaces and three spaces for electrical vehicles (EV). The Project would also include two loading dock areas to accommodate deliveries and loading activities for the proposed data center. Vehicular access to the Project Site would be provided via two new gated driveways located along Saturn Street: one along the western perimeter of the Project Site and the other along the eastern perimeter of the Project Site.

NOT TO SCALE

Kimley»Horn

Project construction is anticipated to occur as two phases, lasting approximately two years, beginning as early as September 2025 and ending as early as August 2027. For purposes of this environmental analysis, opening year is assumed to be 2027. Grading for the proposed improvements would require cut and fill to create building pads. Project construction is estimated to require the export of approximately 65,000 cubic yards (cy) of soil material.

3.0 Regulatory

Federal

Federal Clean Air Act

At the national level air quality is regulated by the Federal Clean Air Act (FCAA) and its amendments. Under the FCAA, the United States Environmental Protection Agency (U.S. EPA) developed the primary and secondary National Ambient Air Quality Standards (NAAQS) for the criteria air pollutants including O_3, NO_2, CO, SO_2, PM10, PM2.5, and lead. Proposed projects in or near nonattainment areas could be subject to more stringent air-permitting requirements. The FCAA requires each State to prepare a State Implementation Plan (SIP) to demonstrate how it will attain the NAAQS within the federally imposed deadlines.

The U.S. EPA can withhold certain transportation funds from states that fail to comply with the planning requirements of the FCAA. If a State fails to correct these planning deficiencies within two years of Federal notification, the U.S. EPA is required to develop a Federal implementation plan for the identified nonattainment area or areas. The provisions of 40 Code of Federal Regulations Parts 51 and 93 apply in all nonattainment and maintenance areas for transportation-related criteria pollutants for which the area is designated nonattainment or has a maintenance plan.

State

California Air Resources Board

CARB administers the air quality policy in California. The California Ambient Air Quality Standards (CAAQS) were established in 1969 pursuant to the Mulford-Carrell Act. The CAAQS, included with the NAAQS in **Table 4**, are generally more stringent and apply to more pollutants than the NAAQS. In addition to the criteria pollutants, CAAQS have been established for visibility reducing particulates, hydrogen sulfide, and sulfates.

The California Clean Air Act (CCAA), which was approved in 1988, requires that each local air district prepare and maintain an Air Quality Management Plan (AQMP) to achieve compliance with CAAQS. These AQMPs also serve as the basis for the preparation of the SIP for meeting NAAQS for the State

of California. Like the U.S. EPA, CARB also designates areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a CAAQS for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events such as wildfires, volcanoes, etc. are not considered violations of a CAAQS, and are not used as a basis for designating areas as nonattainment. The applicable CAAQS are summarized in **Table 1.**

Table 1: State and National Ambient Air Quality Standards

Pollutant	Averaging Time	State Standards[1]	National Standards[2]
Ozone (O_3) [2, 5, 7]	8 Hour	0.070 ppm (137 µg/m^3)	0.070 ppm
	1 Hour	0.09 ppm (180 µg/m^3)	NA
Carbon Monoxide (CO)	8 Hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)
	1 Hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)
Nitrogen Dioxide (NO_2)	1 Hour	0.18 ppm (339 µg/m^3)	0.10 ppm[11]
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)
Sulfur Dioxide (SO_2) [8]	24 Hour	0.04 ppm (105 µg/m^3)	0.14 ppm (365 µg/m^3)
	1 Hour	0.25 ppm (655 µg/m^3)	0.075 ppm (196 µg/m^3)
	Annual Arithmetic Mean	NA	0.03 ppm (80 µg/m^3)
Particulate Matter (PM10) [1, 3, 6]	24-Hour	50 µg/m^3	150 µg/m^3
	Annual Arithmetic Mean	20 µg/m^3	NA
Fine Particulate Matter (PM2.5) [3, 4, 6, 9]	24-Hour	NA	35 µg/m^3
	Annual Arithmetic Mean	12 µg/m^3	9.0 µg/m^3
Sulfates (SO_{4-2})	24 Hour	25 µg/m^3	NA
Lead (Pb) [10, 11]	30-Day Average	1.5 µg/m^3	NA
	Calendar Quarter	NA	1.5 µg/m^3
	Rolling 3-Month Average	NA	0.15 µg/m^3
Hydrogen Sulfide (H_2S)	1 Hour	0.03 ppm (0.15 µg/m^3)	NA
Vinyl Chloride (C_2H_3Cl) [10]	24 Hour	0.01 ppm (26 µg/m^3)	NA

Notes:

ppm = parts per million; µg/m^3 = micrograms per cubic meter; mg/m^3 = milligrams per cubic meter; NA = no information available.

1. California standards for O_3, carbon monoxide (except Lake Tahoe), sulfur dioxide (1-hour and 24-hour), nitrogen dioxide, suspended particulate matter – PM10, and visibility reducing particles are values that are not to be exceeded. The standards for sulfates, Lake Tahoe CO, lead, hydrogen sulfide, and vinyl chloride are not to be equaled or exceeded. If the standard is for a 1-hour, 8-hour or 24-hour average (i.e., all standards except for lead and the PM10 annual standard), then some measurements may be excluded. Measurements are excluded that CARB determines would occur less than once per year on the average. The Lake Tahoe carbon monoxide standard is 6.0 ppm, a level one-half the national standard and two-thirds the State standard.
2. National standards shown are the "primary standards" designed to protect public health. National standards other than for O_3, particulates and those based on annual averages are not to be exceeded more than once a year. The 1-hour O_3 standard is attained if, during the most recent three-year period, the average number of days per year with maximum hourly concentrations above the standard is equal to or less than one. The 8-hour O_3 standard is attained when the 3-year average of the 4th highest daily concentrations is 0.070 ppm or less. The 24-hour PM10 standard is attained when the 3-year average of the 99th percentile of

Table 1: State and National Ambient Air Quality Standards			
Pollutant	**Averaging Time**	**State Standards[1]**	**National Standards[2]**

monitored concentrations is less than 150 µg/m_3. The 24-hour PM2.5 standard is attained when the 3-year average of 98th percentiles is less than 35 µg/m^3.

3. Except for the national particulate standards, annual standards are met if the annual average falls below the standard at every site. The national annual particulate standard for PM10 is met if the 3-year average falls below the standard at every site. The annual PM2.5 standard is met if the 3-year average of annual averages spatially-averaged across officially designed clusters of sites falls below the standard. NAAQS are set by the U.S. EPA at levels determined to be protective of public health with an adequate margin of safety.
4. On October 1, 2015, the national 8-hour O_3 primary and secondary standards were lowered from 0.075 to 0.070 ppm. An area will meet the standard if the fourth-highest maximum daily 8-hour O_3 concentration per year, averaged over three years, is equal to or less than 0.070 ppm. U.S. EPA will make recommendations on attainment designations by October 1, 2016, and issue final designations October 1, 2017. Nonattainment areas will have until 2020 to late 2037 to meet the health standard, with attainment dates varying based on the O_3 level in the area.
5. The national 1-hour O_3 standard was revoked by the U.S. EPA on June 15, 2005.
6. In June 2002, CARB established new annual standards for PM2.5 and PM10.
7. The 8-hour California O_3 standard was approved by the CARB on April 28, 2005 and became effective on May 17, 2006.
8. On June 2, 2010, the U.S. EPA established a new 1-hour SO_2 standard, effective August 23, 2010, which is based on the 3-year average of the annual 99th percentile of 1-hour daily maximum concentrations. The existing 0.030 ppm annual and 0.14 ppm 24-hour SO_2 NAAQS however must continue to be used until one year following U.S. EPA initial designations of the new 1-hour SO_2 NAAQS.
9. In December 2012, U.S. EPA strengthened the annual PM2.5 NAAQS from 15.0 to 12.0 µg/m^3. In December 2014, the U.S. EPA issued final area designations for the 2012 primary annual PM2.5 NAAQS. Areas designated "unclassifiable/attainment" must continue to take steps to prevent their air quality from deteriorating to unhealthy levels. The effective date of this standard is April 15, 2015.
10. CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure below which there are no adverse health effects determined.
11. National lead standard, rolling 3-month average: final rule signed October 15, 2008. Final designations effective December 31, 2011.

Source: South Coast Air Quality Management District, *Air Quality Management Plan*, 2022; California Air Resources Board, *Ambient Air Quality Standards*, May 6, 2016, and U.S. EPA, NAAQS Table, February 7, 2024.

Regional

South Coast Air Quality Management District

Regionally, air quality is governed by the South Coast Air Quality Management District (SCAQMD), the air pollution control agency for Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino Counties. The SCAQMD's primary responsibility is ensuring that California Ambient Air Quality Standards (CAAQS) and NAAQS are attained and maintained in the South Coast Air Basin (SoCAB). The SCAQMD is also responsible for adopting and enforcing rules and regulations concerning air pollutant sources, issuing permits for stationary sources of air pollutants, inspecting stationary sources of air pollutants, responding to citizen complaints, monitoring ambient air quality and meteorological conditions, awarding grants to reduce motor vehicle emissions, conducting public education campaigns, and many other activities.

The SCAQMD is also the lead agency in charge of developing the Air Quality Management Plan (AQMP), with input from the Southern California Association of Governments (SCAG) and the CARB. The AQMP is a comprehensive plan that includes control strategies for stationary and area sources, as well as for some on-road and off-road mobile sources. SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for

regional issues relating to transportation, the economy, community development, and the environment. Under federal law, SCAG is designated as a Metropolitan Planning Organization and under State law as a Regional Transportation Planning Agency and a Council of Governments. SCAG has the primary responsibility for providing future growth projections and the development and implementation of transportation control measures. CARB, in coordination with federal agencies, provides the control element for mobile sources.

The 2016 AQMP was adopted by the SCAQMD Governing Board on March 3, 2017. The purpose of the AQMP is to set forth a comprehensive and integrated program that would lead the air basin into compliance with the federal 24-hour PM2.5 air quality standard, and to provide an update to the SCAQMD's commitments towards meeting the 8-hour O_3 NAAQS. Specifically, the 2016 AQMP covers the following NAAQS: 1979 1-hour O_3 NAAQS, 1997 8-hour O_3 NAAQS, 2006 24-hour PM2.5 NAAQS, 2008 8-hour O_3 NAAQS, and the 2012 annual PM2.5 NAAQS.

The 2022 AQMP, adopted by the SCAQMD Governing Board on December 2, 2022, was developed to address the requirements for meeting the 2015 8-hour O_3 standard. The 2022 AQMP builds upon measures already in place from previous AQMPs. It also includes a variety of additional strategies such as regulations, accelerated deployment of available cleaner technologies (e.g., zero emissions technologies, when cost-effective and feasible, and low NO_X technologies in other applications), best management practices, co-benefits from existing programs (e.g., climate and energy efficiency), incentives, and other FCAA measures to achieve the 2015 8-hour O_3 standard. An AQMP is a regional and multi-agency effort including the SCAQMD, the CARB, the SCAG, and the EPA. The 2022 AQMP incorporates the latest scientific and technological information and planning assumptions, including the *2020-2045 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS), entitled Connect SoCal 2024 RTP/SCS (referred to as "Connect SoCal") and updated emission inventory methodologies for various source categories. Connect SoCal was approved by SCAG regional council on April 4, 2024, however CARB must formally approve the plan.

The SCAQMD has published the *CEQA Air Quality Handbook* (approved by the SCAQMD Governing Board in 1993 and augmented with guidance for Localized Significance Thresholds [LSTs] in 2008). The SCAQMD guidance helps local government agencies and consultants to develop environmental documents required by California Environmental Quality Act (CEQA) and provides identification of suggested thresholds of significance for criteria pollutants for both construction and operation (see discussion of thresholds below). With the help of the *CEQA Air Quality Handbook* and associated guidance, local land use planners and consultants are able to analyze and document how proposed and existing projects affect air quality in order to meet the requirements of the CEQA review process.

The SCAQMD periodically provides supplemental guidance and updates to the handbook on their website.

The State and federal attainment status designations for the SoCAB are summarized in **Table 2: South Coast Air Basin Attainment Status**. The SoCAB is currently designated as a nonattainment area for the O_3, PM10, and PM2.5 CAAQS, as well as the 8-hour O_3 and PM2.5 NAAQS. The SoCAB is designated as attainment or unclassified for the remaining CAAQS and NAAQS.

Table 2: South Coast Air Basin Attainment Status

Pollutant	State	Federal
Ozone (O_3) (1 Hour Standard)	Non-Attainment	Non-Attainment (Extreme)
Ozone (O_3) (8 Hour Standard)	Non-Attainment	Non-Attainment (Extreme)
Particulate Matter (PM2.5) (24 Hour Standard)	–	Non-Attainment (Serious)
Particulate Matter (PM2.5) (Annual Standard)	Non-Attainment	Non-Attainment (Serious)
Particulate Matter (PM10) (24 Hour Standard)	Non-Attainment	Attainment (Maintenance)
Particulate Matter (PM10) (Annual Standard)	Non-Attainment	–
Carbon Monoxide (CO) (1 Hour Standard)	Attainment	Attainment (Maintenance)
Carbon Monoxide (CO) (8 Hour Standard)	Attainment	Attainment (Maintenance)
Nitrogen Dioxide (NO_2) (1 Hour Standard)	Attainment	Unclassifiable/Attainment
Nitrogen Dioxide (NO_2) (Annual Standard)	Attainment	Attainment (Maintenance)
Sulfur Dioxide (SO_2) (1 Hour Standard)	Attainment	Unclassifiable/Attainment
Sulfur Dioxide (SO_2) (24 Hour Standard)	Attainment	–
Lead (Pb) (30 Day Standard)	–	Unclassifiable/Attainment
Lead (Pb) (3 Month Standard)	Attainment	–
Sulfates (SO_{4-2}) (24 Hour Standard)	Attainment	–
Hydrogen Sulfide (H_2S) (1 Hour Standard)	Unclassified	–

The following is a list of SCAQMD rules that are required of construction and operational activities associated with the Project:

- **Rule 402 (Nuisance)** – This rule prohibits the discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. This rule does not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.
- **Rule 403 (Fugitive Dust)** – This rule requires fugitive dust sources to implement best available control measures for all sources, and all forms of visible particulate matter are prohibited from crossing any property line. This rule is intended to reduce PM10 emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust. PM10 suppression techniques are summarized below.
    - Portions of a construction site to remain inactive longer than a period of three months will be seeded and watered until grass cover is grown or otherwise stabilized.
    - All on-site roads will be paved as soon as feasible or watered periodically or chemically stabilized.
    - All material transported off-site will be either sufficiently watered or securely covered to prevent excessive amounts of dust.
    - The area disturbed by clearing, grading, earthmoving, or excavation operations will be minimized at all times.
    - Where vehicles leave a construction site and enter adjacent public streets, the streets will be swept daily or washed down at the end of the work day to remove soil tracked onto the paved surface.
- **Rule 1113 (Architectural Coatings)** – This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce ROG emissions from the use of these coatings, primarily by placing limits on the ROG content of various coating categories.
- **Rule 1401 (New Source Review of Toxic Air Contaminants)** – This rule establishes limits for maximum individual cancer risk (MICR), cancer burden, and noncancer acute and chronic

hazard index (HI) from new permit units, relocations, or modifications to existing permit units which emit applicable toxic air contaminants. DPM is a substance listed in Table 1 of the Rule.[1] Therefore, the requirements to allow the construction and use of the new generators are as follows:

- **MICR and Cancer Burden:** The cumulative increase in MICR which is the sum of the calculated MICR values for all toxic air contaminants emitted from the new, relocated or modified permit unit will not result in any of the following:
  - an increased MICR greater than one in one million (1.0×10^{-6}) at any receptor location, if the permit unit is constructed without TBACT;
  - an increased MICR greater than ten in one million (10×10^{-6}) at any receptor location, if the permit unit is constructed with T-BACT;
  - a cancer burden greater than 0.5.
- **Chronic Hazard Index:** The cumulative increase in total chronic HI for any target organ system due to total emissions from the new, relocated or modified permit unit owned or operated by the applicant for which applications were deemed complete on or after the date when the risk value for the compound is finalized by the state Office of Environmental Health Hazard Assessment (OEHHA) will not exceed 1.0 at any receptor location.
- **Acute Hazard Index:** The cumulative increase in total acute HI for any target organ system due to total emissions from the new, relocated or modified permit unit owned or operated by the applicant for which applications were deemed complete on or after the date when the risk value for the compound is finalized by OEHHA will not exceed 1.0 at any receptor location.

- **Rule 1402 (Control of Toxic Air Contaminants From Existing Sources)** – This rule reduces the health risk associated with emissions of TACs from existing sources by specifying notification risk levels, action risk levels, and significant risk levels for MICR, cancer burden, and non-cancer acute and chronic HI applicable to total facility emissions. The rule establishes requirements to implement Risk Reduction Plans to achieve specified risk limits, as required by the Hot Spots Act and this rule.
- **Rule 1403 (Asbestos Emissions From Demolition/Renovation Activities)** – This rule applies to owners and operators of any demolition or renovation activity, and the associated disturbance of asbestos-containing material (ACM), any asbestos storage facility, or any active waste disposal site. This rule includes requirements for activities, handling and clean-up procedures, storage, disposal and landfill requirements.

[1] SCAQMD, Rule 1401, page 1401-17, http://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1401.pdf?sfvrsn=4. Accessed April 22, 2024.

- **Rule 1415 (Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems)** – The purpose of this rule is to reduce emissions of high-global warming potential refrigerants from stationary air conditioning systems by requiring project's to reclaim, recover, or recycle refrigerant and minimize leakage.
- **Rule 1466 (Control Of Particulate Emissions from Soils With Toxic Air Contaminants)** – This rule applies to projects with earth-moving activities of soil with applicable toxic air contaminants (TACs) that have been identified as contaminants of concern at a site.
- **Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines)** – This rule applies to stationary compression ignition (CI) engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

Ambient Air Quality

The SCAQMD maintains a network of air quality monitoring stations located throughout the South Coast Air Basin to measure ambient pollutant concentrations. The Project Site is located in SCAQMD Source Receptor Area (SRA) 11; therefore, the monitoring station most representative of the Project Site is the South San Gabriel Valley Monitoring Station. Criteria pollutants monitored at this station include ozone (O_3), NO_2, and CO, and PM2.5. The East San Gabriel Valley Monitoring Station, east of the Project Site, was used to report data for PM10. The Central LA Station, south of the Project Site, is the nearest, most representative station with recorded data for SO_2 and lead. The most recent pollutant concentration data available from the SCAQMD for these monitoring stations are from years 2020 to 2022 and are summarized in **Table 3: Ambient Air Quality Data.**

Table 3: Ambient Air Quality Data

Pollutant/Standard[1,2]	2020	2021	2022
O_3 (1-hour)			
Maximum Concentration (ppm)	0.169	0.104	0.123
Number of Days > CAAQS (0.09 ppm)	20	2	3
O_3 (8-hour)			
Maximum Concentration (ppm)	0.114	0.074	0.091
4th High 8-hour Concentration (ppm)	0.089	0.068	0.070
Number of Days > CAAQS (0.070 ppm)	23	3	2
Number of Days > NAAQS (0.070 ppm)	23	3	3

Table 3: Ambient Air Quality Data			
Pollutant/Standard[1,2]	**2020**	**2021**	**2022**
NO_2 (1-hour)			
Maximum Concentration (ppm)	0.069	0.072	0.065
98th Percentile Concentration (ppm)	0.058	0.055	0.054

Local

City of Monterey Park General Plan

The City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City's General Plan has multiple elements that contain the following policies specific to air quality potentially applicable to the Project:

Land Use and Urban Design Element

Goal 4: A built environment that is resilient and promotes health and wellness.

Policy 4.5 New Development: Ensure new development is planned in areas that can sustain it long-term considering air quality, health indicators of residents, infrastructure networks and services, and socio-economic factors.

Resources Element

Goal 5: Improve air quality for future generations of Monterey Park residents.

Policy 5.8 Integrate air quality planning with land use and transportation planning.

Environmental Justice Element

Goal 2: Community health and the reduction of exposure to environmental pollutants is a priority and part of all planning and policy practices.

Policy 2.1 Limit exposure to environmental pollution through good planning and the public process.

4.0 Significance Criteria and Methodology

Air Quality Thresholds

Based on the criteria derived from Appendix G of the CEQA Guidelines, a project normally would have a significant effect on the environment if it would:

- Conflict with or obstruct implementation of the applicable air quality plan,
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or State ambient air quality standard,
- Expose sensitive receptors to substantial pollutant concentrations, or
- Result in other emissions (such as leading to odors) adversely affecting a substantial number of people.

SCAQMD Thresholds

The significance criteria established by SCAQMD may be relied upon to make the above determinations. According to the SCAQMD, an air quality impact is considered significant if a Project would violate an ambient air quality standard, contribute substantially to an existing or projected air quality violation, or expose sensitive receptors to substantial pollutant concentrations. The SCAQMD has established numeric thresholds of significance for air pollutants resulting from construction and operational activities of land use development projects, as shown in **Table 4: South Coast Air Quality Management District Significance Thresholds**.

Table 4: South Coast Air Quality Management District Regional Significance Thresholds		
Pollutant	**Mass Daily Thresholds (pounds per day)**	
	Construction	**Operations**
Nitrogen Oxides (NO_X)	100	55
Volatile Organic Compounds (VOC)[1]	75	55
Particulate Matter up to 10 Microns (PM10)	150	150
Particulate Matter up to 2.5 Microns (PM2.5)	55	55
Sulphur Oxides (SO_X)	150	150
Carbon Monoxide (CO)	550	550
1. VOCs and ROGs are subsets of organic gases that are emitted from the incomplete combustion of hydrocarbons or other carbon-based fuels. Although they represent slightly different subsets of organic gases, they are used interchangeably for the purposes of this analysis.		
Source: South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019.		

Localized Carbon Monoxide

In addition to the daily thresholds listed above, development associated with the Project would also be subject to the CAAQS and NAAQS. These are addressed though an analysis of localized CO impacts. The significance of localized impacts depends on whether ambient CO levels near the Project are above CAAQS and NAAQS for CO (the more stringent CAAQS are 20 ppm for 1-hour and 9 ppm for 8-hour). The SoCAB has been designated as attainment of the 1-hour and 8-hour CAAQS.

Localized Significance Thresholds

The SCAQMD developed Localized Significance Thresholds (LSTs) for emissions of NO_2, CO, PM10, and PM2.5 generated at new development sites (off-site mobile source emissions are not included in the LST analysis). LSTs represent the maximum emissions that can be generated at a project without expecting to cause or substantially contribute to an exceedance of the most stringent state or federal ambient air quality standards. LSTs are based on the ambient concentrations of that pollutant within the Project source receptor area (SRA), as demarcated by the SCAQMD, and the distance to the nearest sensitive receptor. LST analysis for construction is applicable for projects that disturb 5 acres

or less on a single day. The City of Monterey Park is located within SCAQMD SRA 11 (South Coastal Los Angeles County). The nearest sensitive receptors are located approximately 65 feet from the Project Site (approximately 20 meters). LST thresholds are provided for source-receptor distances of 25, 50, 100, 200, and 500 meters. According to SCAQMD's *Localized Significance Threshold Methodology*, the closest receptor distance on the mass rate LST look-up tables is 25 meters. It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.[2] Therefore, LSTs for 25 meters were utilized in this analysis. LSTs associated with the 25-meter threshold are provided in **Table 5: Local Significance Thresholds for Construction/Operations** for informational purposes and to demonstrate that the thresholds increase as acreages increase.

Table 5: Local Significance Thresholds for Construction and Operations

Project Size	Maximum Pounds Per Day[1,2]							
	Construction				Operations			
	NO_x	CO	PM10	PM2.5	NO_x	CO	PM10	PM2.5
1 Acre	83	673	5	4	83	673	1	1
2 Acres	121	1,031	7	5	121	1,031	2	2
5 Acres	183	1,814	14	9	183	1,814	4	2

1. NO_X = Nitrogen Oxides; CO = Carbon Monoxide; PM10 = Particulate Matter 10 microns in diameter or less; PM2.5 = Particulate Matter 2.5 microns in diameter or less
2. Based on receptor distance of 25 meters based on SRA 11.

Source: SCAQMD, Localized Significance Threshold Methodology, July 2008.

Methodology

The Project's construction and operational emissions were calculated using the California Emissions Estimator Model version 2022.1.1.21 (CalEEMod). Details of the modeling assumptions and emission factors are provided in **Appendix A**. For construction, CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. Per the Transportation Analysis prepared for the Project, the Project is anticipated to generate approximately 52 daily vehicle trips. The modeling assumed "general office building" as the land use subtype because it was the most applicable as data center is not an available subtype in the model. The "general office building" was chosen as a data center has similar building structure to an office building with primarily large open rooms with high ceilings and many individual smaller spaces for tenants. However, the electricity, natural gas, indoor and outdoor water, and daily trips were changed from default to information provided by the Applicant to more accurately represent the Project

[2] SCAQMD, *Localized Significance Threshold Methodology*, July 2008, https://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf. Accessed February 8, 2024.

characteristics and associated air quality emissions. Per information provided from the Applicant, the Project would require approximately 438 GwH per year of electricity and approximately 12 million gallons of water for indoor and outdoor water usage. No natural gas is proposed for the building.

5.0 Impact Analysis

Threshold (a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

As part of its enforcement responsibilities, the U.S. EPA requires each state with nonattainment areas to prepare and submit a SIP that demonstrates the means to attain the federal standards. The SIP must integrate federal, state, and local plan components and regulations to identify specific measures to reduce pollution in nonattainment areas, using a combination of performance standards and market-based programs. Similarly, under State law, the CCAA requires an air quality attainment plan to be prepared for areas designated as nonattainment regarding the state and federal ambient air quality standards. Air quality attainment plans outline emissions limits and control measures to achieve and maintain these standards by the earliest practical date.

The Project is located within the SoCAB, which is under the jurisdiction of the SCAQMD. The SCAQMD is required, pursuant to the FCAA, to reduce emissions of criteria pollutants for which the SoCAB is in nonattainment. To reduce such emissions, the SCAQMD adopted the 2016 AQMP and recently approved the 2022 AQMP (collectively, the "AQMPs"). The AQMPs establish a program of rules and regulations directed at reducing air pollutant emissions and achieving state (California) and national air quality standards. Because CARB approval of the 2022 AQMP may be reached during the expected Project entitlement period, this analysis compares The Project to both of the SCAQMD's AQMPs.

Criteria for determining project consistency with the AQMP are defined by the following indicators:

- **Consistency Criterion No. 1**: The Project will not result in an increase in the frequency or severity of existing air quality violations, or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

- **Consistency Criterion No. 2**: The Project will not exceed the assumptions in the AQMP or increments based on the years of the Project build-out phase.

According to the SCAQMD's *CEQA Air Quality Handbook*, the purpose of the consistency finding is to determine if a project is inconsistent with the assumptions and objectives of the regional air quality plans, and thus if it would interfere with the region's ability to comply with CAAQS and NAAQS.

The violations to which Consistency Criterion No. 1 refers are CAAQS and NAAQS. As discussed in Threshold b below, the Project would not exceed construction or operational emissions standards. Therefore, the Project would not contribute to an existing air quality violation, or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP. Thus, the Project is consistent with the first criterion.

Concerning Consistency Criterion No. 2, the AQMPs contains air pollutant reduction strategies based on SCAG's latest growth forecasts, and SCAG's growth forecasts were defined in consultation with local governments and with reference to local general plans. As discussed in the City's General Plan, the Project Site is within the Innovation/Technology land use designation. According to the Land Use and Urban Design Element of the General Plan, the primary uses allowed within this land use designation include research and development, light manufacturing, service commercial, professional offices, entertainment, and breweries/wineries. The Project proposes to develop a data center, which is a permitted use within the Innovation/Technology land use designation. The Project Site is zoned Office Professional (Voter Enacted) (O-P). Pursuant to MPMC Chapter 21.14, O-P – Office Professional Zone (Voter Enacted), the O-P Zone is intended to provide for the development of integrated professional, office, and limited retail areas that exhibit a diversity of business activity from both revenue and service quality standpoints, and which are compatible and responsive to abutting land uses, including residential developments. As discussed in the *1977 Saturn Data Center Project Initial Study/Mitigated Negative Declaration (Section 4.11, Land Use)*, the Project would be consistent with the zoning for the Project Site, including the land use, floor area ratio (FAR), height, and setback requirements, standards, and limits established in the MPMC for the O-P Zone. The Project is consistent with the land use designation and development density presented in the City's General Plan, and therefore would not exceed the population or job growth projections used by the SCAQMD to develop the AQMPs. Thus, the Project is consistent with the second criterion.

Based on these criteria, the Project would not conflict with or obstruct implementation of the AQMPs and impacts would be less than significant.

Mitigation Measures: No mitigation is required.

Level of Significance: Less Than Significant Impact.

Threshold (b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or State ambient air quality standard?

As shown on **Table 2** above, the SoCAB is classified as non-attainment of the applicable NAAQS and or CAAQS for pollutants: O_3 (precursor pollutants ROG and NO_X),PM10, PM2.5, and lead (for the Los

Angeles County portion only, and is expected to be redesignated to attainment based on recent monitoring[3]). The SoCAB is classified as attainment, maintenance, or unclassifiable for all other criteria pollutants. Nonetheless, the analysis below discloses emissions and applicable thresholds for O_3 precursors, NO_2, PM10, PM2.5, CO, and SO_2. Emissions of lead, hydrogen sulfide, sulfates, and vinyl chloride are not reported, because they would be minimal from the construction and operation of a data center.

Construction Emissions

Construction-generated emissions are short term and of temporary duration, lasting only as long as construction activities occur, but would be considered a significant air quality impact if the amount of pollutants generated exceeds the SCAQMD's thresholds of significance. Sources of emissions during construction include site grading, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces. Emissions of airborne particulate matter are largely dependent on the amount of ground disturbance associated with site preparation activities as well as weather conditions and the appropriate application of water. Sensitive land uses surrounding the Project Site consist mostly of residential communities located adjacent to the Project Site, including single-family residences to the north and west of the Project Site.

Construction-generated emissions associated with the Project were calculated using the CARB-approved California Emissions Estimator Model (CalEEMod), which is designed to model emissions for land use development projects, based on typical construction requirements. See **Attachment A: Air Quality Data** for more information regarding the construction assumptions used in this analysis. Predicted maximum daily construction-generated emissions for the Project are identified in **Table 6: Project Construction Emissions**. The modeling emissions include truck idling time and emissions from heavy-duty diesel equipment.

Table 6: Project Construction Emissions

Calendar Year	Emissions (pounds per day)[1]					
	ROG	NO_X	CO	SO_2	PM10	PM2.5
2025	3.38	52.2	32.4	0.22	9.57	4.02
2026	1.39	11.6	17.9	0.03	1.35	0.69
2027	1.12	6.72	11.3	0.02	1.53	0.49
SCAQMD Threshold	75	100	550	150	150	55

The Project is subject to SCAQMD Rules 402, 403, and 1113, which prohibit nuisances, require dust mitigation, and limit VOC content in paints, respectively. It has been assumed that these rules will be followed using watering the site and low VOC paints during construction. In addition, the Project would follow Rule 1403 to limit asbestos emissions from building demolition. The Project may be required to comply with Rule 1466, *Control of Particulate Emissions from Soils with Toxic Air Contaminants.* The results of the emissions modeling, as summarized on **Table 6**, show that construction criteria pollutant emissions would remain below the applicable thresholds, and construction impacts on short-term regional air quality would be less than significant.

Operational Emissions

The primary purpose of the data center is to house computer servers. Operational sources of emissions include mobile sources (i.e., motor vehicle use for employee commuting) and area sources (such as the use of landscape maintenance equipment, hearths, consumer products, and architectural coatings). In addition, the proposed Project would include up to 12 4-MW stationary emergency diesel generators upon loss of grid power. However, the use of these generators is restricted to periodic maintenance and testing and for continuous use in an emergency situation. The reliance on generators to supply the power needed to keep the data center running during power loss is not expected to be frequent or prolonged, is not a reasonably foreseeable scenario, and therefore is not analyzed under CEQA. **Table 7: Project Operational Emissions** summarizes the operational emissions attributable to the Project.

1. Emissions were calculated using the California Emissions Estimator Model (CalEEMod) version 2022.1.1.22, as recommended by the SCAQMD. Worst-case seasonal maximum daily emissions are reported.						
Source: CalEEMod version 2022.1.1.22. Refer to **Attachment A** for model outputs.						

As shown in **Table 7**, the Project's regional operational emissions would not exceed applicable SCAQMD thresholds, and operational impacts on long-term regional air quality would be less than significant.

The testing and maintenance of the generators would be limited under the terms of SCAQMD operating permits to be obtained by the Applicant, to operate for a maximum of 4.2 hours each month. Emissions would be temporary and variable, and are not considered in these analyses. As part of the regulatory compliance process, the Applicant will obtain Permits to Operate (PTO) from the SCAQMD prior to installation or operation of the emergency generators, which verifies that the generators meet the applicable Best Available Control Technology (BACT) requirements and comply with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) and Rule 1401 (New Source Review of Toxic Air Contaminants). Thus, the facility would not result in a violation of the ambient air standards or result in exposure to TAC emissions in excess of thresholds.

Mitigation Measure: No mitigation is required.

Level of Significance: Less Than Significant Impact.

Threshold (c) Would the project expose sensitive receptors to substantial pollutant concentrations?

Localized Construction Impacts

The nearest sensitive receptors to the Project Site are multi-family residences located approximately 65 feet (approximately 20 meters) northwest of the Project Site. To assess potential impacts to nearby sensitive receptors, the SCAQMD established Localized Significance Thresholds (LSTs). LSTs were developed in response to SCAQMD Governing Boards' Environmental Justice Enhancement Initiative (I-4). The SCAQMD provided the *Final Localized Significance Threshold Methodology* (dated June 2003 [revised 2008]) to assist lead agencies in analyzing project-specific localized impacts. The SCAQMD established LSTs for certain pollutants with localized effects, specifically NO_X, CO, PM10, and PM2.5.

Since CalEEMod calculates construction emissions based on the number of equipment hours and the maximum daily soil disturbance activity possible for each piece of equipment, **Table 8: Equipment-Specific Grading Rates** is used to determine the maximum daily disturbed acreage for comparison to LSTs. A conversion from equipment number to the maximum daily disturbed acreage is calculated. The appropriate source receptor area (SRA) for the localized significance thresholds is the South San Gabriel Valley (SRA 11) area since this area includes the Project Site. LSTs apply to CO, NO_2, PM10, and PM2.5. The SCAQMD produced look-up tables for projects that disturb areas less than or equal to 5 acres in size. Project construction is anticipated to disturb approximately 2.5 acres in a single day. As the LST guidance provides thresholds for projects disturbing 1-, 2-, and 5-acres in size and the thresholds increase with the size of the site, the LSTs for a 2.5-acre threshold were utilized for this analysis.

Table 8: Equipment-Specific Grading Rates

Construction Phase	Equipment Type	Equipment Quantity	Acres Graded per 8-Hour Day	Operating Hours per Day	Acres Graded per Day
Grading	Tractor	3	0.5	8	1.5
	Graders	1	0.5	8	0.5
	Dozers	1	0.5	8	0.5
Total Acres Graded per Day					**2.5**

Source: CalEEMod version 2022.1.1.22.

As stated in the SCAQMD's *Finalized Localized Significance Threshold Methodology,* "off-site mobile emissions from the Project should not be included in the emissions compared to LSTs." Therefore, for purposes of the construction LST analysis, only emissions included in the CalEEMod "on-site" emissions outputs were considered. The nearest sensitive receptors are the residences located approximately 65 feet (approximately 20 meters) northwest to the north of the Project Site. LST thresholds are provided for distances to sensitive receptors of 25, 50, 100, 200, and 500 meters. Therefore, LSTs for 25 meters were utilized in this analysis. **Table 9: Localized Significance of Construction Emissions***,* shows the results of localized emissions during construction activity. This table represents the worse-case scenario and are based on peak earthwork volumes anticipated. As shown in **Table 9,** localized Project construction emissions would not exceed SCAQMD thresholds and impacts would be less than significant.

Table 9: Localized Significance of Construction Emissions				
Source/Activity	**Emissions (pounds per day)[1]**			
	NO_X	**CO**	**PM10**	**PM2.5**
Construction Emissions				
Phase 1 - Demolition (2025)	22.2	19.9	3.9	1.3
Phase 1 – Site Preparation (2025)	31.6	30.2	6.5	3.9
Phase 1 – Grading (2025)	16.3	17.9	2.6	1.6
Phase 1 – Building Construction and Utilities (2026)	9.85	13.0	0.38	0.35
Phase 1 Paving (2026)	7.12	9.94	0.32	0.29
Phase 2 – Interior Construction (2026)	5.27	6.78	0.19	0.18
Phase 2 – Interior Construction (2027)	5.03	6.75	0.17	0.15
Phase 2 – Architectural coating (2027)	0.83	1.13	0.02	0.02
Maximum Daily Emissions	*31.6*	*30.2*	*6.5*	*3.9*
SCAQMD Localized Screening Threshold (2.5 acres of disturbance at 25 meters)	131	1,162	8	6
Exceed SCAQMD Threshold?	**No**	**No**	**No**	**No**

1. Maximum emissions may not add up exactly due rounding in the modeling calculations. Detailed emissions calculations are provided in **Attachment A**.
2. SCAQMD Rule 403 Fugitive Dust applied for construction emissions. The Rule 403 reduction/credits include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces three times daily; water all haul roads three times daily; and limit speeds on unpaved roads to 15 miles per hour. Reductions percentages from the SCAQMD CEQA Handbook (Tables XI-A through XI-E) were applied. No mitigation was applied to construction equipment.

Source: CalEEMod version 2022.1.1.22. Refer to **Attachment A** for model outputs.

Localized Operational Impacts

According to the SCAQMD localized significance threshold methodology, operational LSTs apply to on-site sources. LSTs for receptors located at approximately 25 meters for SRA 11 were utilized in this analysis. Although the Project Site is 15.8 acres, the 5-acre LST threshold was conservatively used because a smaller size LST threshold is more conservative. Therefore, the 5-acre LSTs is a conservative evaluation of a 15.8 acre site.

The on-site operational emissions were calculated using CalEEMod and are compared to the LSTs in **Table 10: Localized Significance of Operational Emissions**. The operational emissions shown in **Table 10** include all on-site Project-related stationary sources (i.e., area and energy).

Table 10: Localized Significance of Operational Emissions				
Source/Activity	**Emissions (pounds per day)[1]**			
	NO_X	**CO**	**PM10**	**PM2.5**
Operational Emissions				
On-Site Emissions (Area + Energy Sources)	7.54	10.5	0.02	0.01
SCAQMD Localized Screening Threshold (5-acre site at 25 meters)	131	1,162	2	2
Exceed SCAQMD Threshold?	**No**	**No**	**No**	**No**
1. Emissions were calculated using the California Emissions Estimator Model version 2022.1.1.20 (CalEEMod), as recommended by the SCAQMD. Worst-case seasonal maximum daily emissions are reported.				
Source: CalEEMod version 2022.1.1.22. Refer to **Attachment A** for model data outputs.				

As shown in **Table 10**, the Project would not generate localized emissions during Project operations. Therefore, the Project would result in a less than significant impact concerning LSTs during operational activities.

Carbon Monoxide Hot Spots

An analysis of CO "hot spots" is needed to determine whether the change in the level of service of an intersection resulting from the Project would have the potential to result in exceedances of the CAAQS or NAAQS. It has long been recognized that CO exceedances are caused by vehicular emissions, primarily when vehicles are idling at intersections. Vehicle emissions standards have become increasingly stringent in the last 20 years. Currently, the CO standard in California is a maximum of 3.4 grams per mile for passenger cars (requirements for certain vehicles are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities, CO concentrations have steadily declined. Accordingly, with the steadily decreasing CO emissions from vehicles, even very busy intersections do not result in exceedances of the CO standard.

The SoCAB was re-designated as attainment in 2007 and is no longer addressed in the SCAQMD's AQMP. The 2003 AQMP is the most recent version that addresses CO concentrations. As part of the SCAQMD *CO Hotspot Analysis*, the Wilshire Boulevard/Veteran Avenue intersection, one of the most congested intersections in Southern California with an average daily traffic (ADT) volume of approximately 100,000 vehicles per day, was modeled for CO concentrations. This modeling effort identified a CO concentration high of 4.6 ppm, which is well below the 35-ppm Federal standard. The Project considered herein would not produce the volume of traffic required to generate a CO hot spot in the context of SCAQMD's *CO Hotspot Analysis*. As the CO hotspots were not experienced at the Wilshire Boulevard/Veteran Avenue intersection even as it accommodates 100,000 vehicles daily, it

can be reasonably inferred that CO hotspots would not be experienced at any vicinity intersections as the Project would result in 52 daily trips.[4] Therefore, impacts would be less than significant.

Mitigation Measure: No mitigation is required.

Level of Significance: Less than Significant Impact.

Threshold (d) Would the project create objectionable odors affecting a substantial number of people?

Construction

Odors that could be generated by construction activities are required to follow SCAQMD Rule 402 to prevent odor nuisances on sensitive land uses. SCAQMD Rule 402, Nuisance, states:

> *A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.*

During construction, emissions from construction equipment, such as diesel exhaust, and volatile organic compounds from architectural coatings and paving activities may generate odors. However, these odors would be temporary, are not expected to affect a substantial number of people and would disperse rapidly. Therefore, impacts related to odors associated with the Project's construction-related activities would be less than significant.

Operations

The SCAQMD *CEQA Air Quality Handbook* identifies certain land uses as sources of odors. These land uses include agriculture (farming and livestock), wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding. The Project would not include any of the land uses that have been identified by the SCAQMD as odor sources. Therefore, the Project would not create objectionable odors.

Mitigation Measures: No mitigation is required.

Level of Significance: No Impact.

[4] Kimley-Horn and Associates, Inc., Transportation Analysis and Vehicle Miles Traveled Screening, April 5, 2024.

6.0 Conclusion

Project implementation would result in less than significant construction and operational air quality impacts, and no mitigation is required.

Phase 1 Paving	Paving	8/2/2026	8/31/2026	5.00	21.0	—
Phase 2 Architectural Coating	Architectural Coating	6/1/2027	8/31/2027	5.00	66.0	—

5.2. Off-Road Equipment

5.2.1. Unmitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Phase 1 Demolition	Concrete/Industrial Saws	Diesel	Average	1.00	8.00	33.0	0.73
Phase 1 Demolition	Rubber Tired Dozers	Diesel	Average	2.00	8.00	367	0.40
Phase 1 Demolition	Excavators	Diesel	Average	3.00	8.00	36.0	0.38

Phase 1 Site Preparation	Tractors/Loaders/Backhoes	Diesel	Average	4.00	8.00	84.0	0.37
Phase 1 Site Preparation	Rubber Tired Dozers	Diesel	Average	3.00	8.00	367	0.40
Phase 1 Grading	Graders	Diesel	Average	1.00	8.00	148	0.41
Phase 1 Grading	Excavators	Diesel	Average	1.00	8.00	36.0	0.38
Phase 1 Grading	Tractors/Loaders/Backhoes	Diesel	Average	3.00	8.00	84.0	0.37
Phase 1 Grading	Rubber Tired Dozers	Diesel	Average	1.00	8.00	367	0.40
Phase 1 Building Construction and Utilities	Tractors/Loaders/Backhoes	Diesel	Average	3.00	7.00	84.0	0.37
Phase 1 Building Construction and Utilities	Cranes	Diesel	Average	1.00	7.00	367	0.29
Phase 1 Building Construction and Utilities	Forklifts	Diesel	Average	3.00	8.00	82.0	0.20
Phase 1 Building Construction and Utilities	Generator Sets	Diesel	Average	1.00	8.00	14.0	0.74
Phase 1 Building Construction and Utilities	Welders	Diesel	Average	1.00	8.00	46.0	0.45
Phase 2 Interior Construction	Forklifts	Diesel	Average	3.00	8.00	82.0	0.20
Phase 2 Interior Construction	Generator Sets	Diesel	Average	1.00	8.00	14.0	0.74
Phase 2 Interior Construction	Welders	Diesel	Average	1.00	8.00	46.0	0.45
Phase 2 Interior Construction	Air Compressors	Diesel	Average	1.00	8.00	37.0	0.48
Phase 1 Paving	Pavers	Diesel	Average	2.00	8.00	81.0	0.42
Phase 1 Paving	Paving Equipment	Diesel	Average	2.00	8.00	89.0	0.36

Saturn Data Center Project - Operations Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Saturn Data Center Project - Operations
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	0.50
Precipitation (days)	18.2
Location	1977 Saturn St, Monterey Park, CA 91755, USA
County	Los Angeles-South Coast
City	Monterey Park
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	4170
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.22

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
General Office Building	218	1000sqft	5.01	218,400	113,291	0.00	—	—

Parking Lot	68.0	Space	0.61	0.00	0.00	0.00	—	—
General Office Building	24.0	1000sqft	0.55	24,000	0.00	0.00	—	Proxy for Substation

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat

Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3
Pesticides	36.2

Toxic Releases	81.8
Traffic	97.9
Effect Indicators	—
CleanUp Sites	68.9
Groundwater	0.00
Haz Waste Facilities/Generators	60.2
Impaired Water Bodies	0.00
Solid Waste	0.00

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat

Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3
Pesticides	36.2

Toxic Releases	81.8
Traffic	97.9
Effect Indicators	—
CleanUp Sites	68.9

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat

Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3
Pesticides	36.2

Toxic Releases	81.8
Traffic	97.9

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
General Office Building	0.00	0%
Parking Lot	0.61	100%
General Office Building	0.00	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	0.00	532	0.03	< 0.005
2026	0.00	532	0.03	< 0.005
2027	0.00	532	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit

Temperature and Extreme Heat	16.2	annual days of extreme heat
Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3

Pesticides	36.2
Toxic Releases	81.8
Traffic	97.9
Effect Indicators	—
CleanUp Sites	68.9
Groundwater	0.00
Haz Waste Facilities/Generators	60.2
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	17.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	63.0
Healthy Places Index Score for Project Location (b)	48.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Square footage according to project description.
Construction: Construction Phases	Changes according to client's project construction schedule
Construction: Off-Road Equipment	anticipated construction equipment based on assumptions

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat

Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3
Pesticides	36.2

Toxic Releases	81.8
Traffic	97.9
Effect Indicators	—
CleanUp Sites	68.9
Groundwater	0.00
Haz Waste Facilities/Generators	60.2
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat

Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3
Pesticides	36.2

Toxic Releases	81.8
Traffic	97.9
Effect Indicators	—
CleanUp Sites	68.9
Groundwater	0.00
Haz Waste Facilities/Generators	60.2
Impaired Water Bodies	0.00
Solid Waste	0.00

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat

Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	63.0
Healthy Places Index Score for Project Location (b)	48.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification

Operations: Vehicle Data	Changes according to Project Trip Rate
Operations: Energy Use	Values provided by client.
Operations: Water and Waste Water	Values provided by client.
Characteristics: Utility Information	Carbon neutrality by 2045 per SB 100

Appendix A-2

Offsite Improvements for Southern California Edison Service

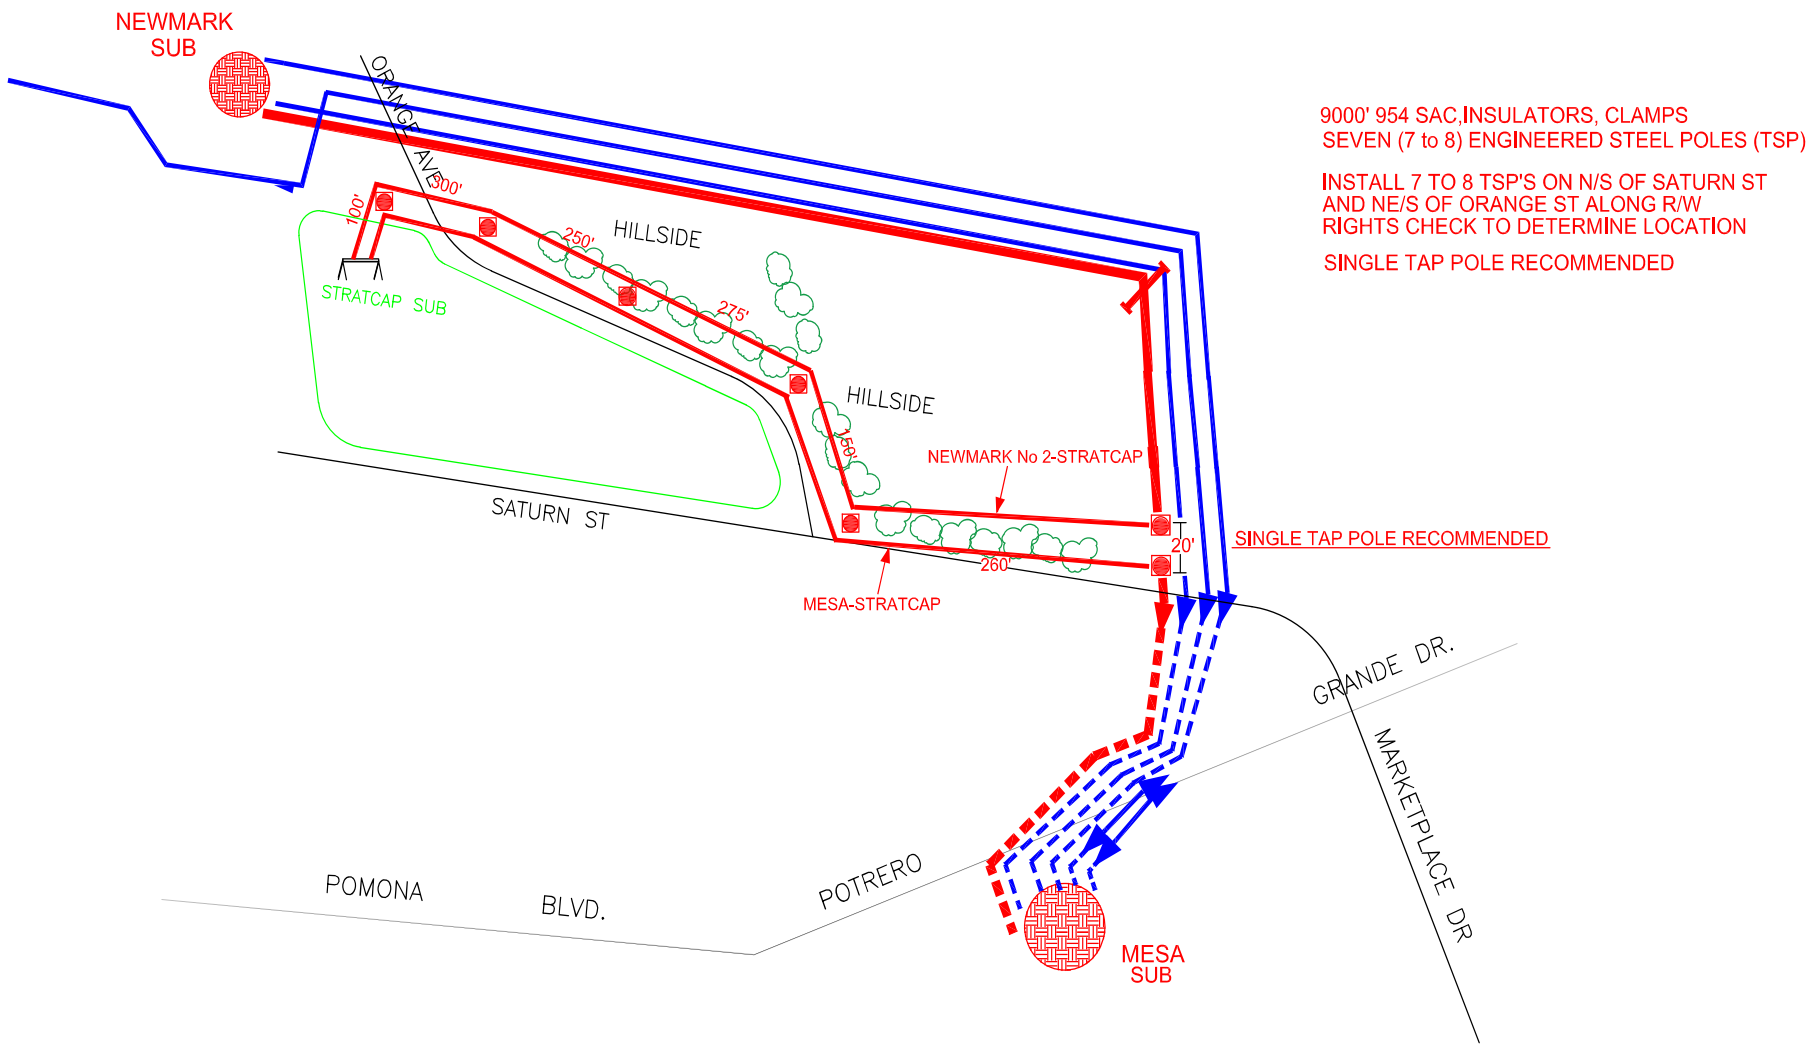
Kimley»Horn

MEMORANDUM

To: Bryan Marsh, CEO, SDCF Monterey Park, LLC

From: Noemi Wyss, AICP, Kimley-Horn and Associates, Inc.

Date: September 3, 2024



Subject: 1977 Saturn Data Center Project – Offsite Improvements for Southern California Edison Service

1.0 Purpose

The purpose of this memorandum is to assess potential impacts due to criteria air pollutant emissions, greenhouse gas (GHG) emissions, noise, and energy associated with construction of the offsite improvements for Southern California Edison (SCE) services. This memorandum is intended to supplement the Air Quality, GHG Emissions, and Noise technical memorandums prepared by Kimley-Horn for the 1977 Saturn Data Center Project (Project) Initial Study/Mitigated Negative Declaration (IS/MND).

2.0 Offsite Improvements for Southern California Edison Service

Southern California Edison (SCE) prepared a Method of Service Study (MOS) that verified SCE can provide power to the Project. The MOS identified the nearby Mesa Substation and the Newmark Substation as the sources of electricity for the Project. The electricity line routes from the Project to the substations, as well as the associated SCE infrastructure, as illustrated in **Figure 1: Offsite Improvements for Southern California Edison Service**. In addition, the MOS identified telecom transmission line routes from the Project to existing telecom infrastructure located at the Mesa Substation and along Potrero Grande Drive, as illustrated in **Figure 2: Transmission Telecom Improvements**. Per the MOS, preliminary review of the line routes assumes SCE will install its new facilities in franchise and/or within existing SCE right-of-way.

FIGURE 2: TRANSMISSION TELECOM IMPROVEMENTS

1977 Saturn Street Project

NOT TO SCALE

Kimley»Horn

As noted in the MOS, the construction of the transmission lines would require a Permit To Construct (PTC) from the California Public Utilities Commission (CPUC). The MOS concluded that construction of the transmission facilities would qualify for a PTC exemption when such construction activities are included in the environmental review of the Project for purposes of CEQA review. Accordingly, the IS/MND includes analysis of the SCE offsite improvements identified in the MOS for the Project.

The SCE improvements would include installation of new overhead and/or underground facilities that connect the SCE substations, and the existing telecom infrastructure, to the Project. That construction would be minor and likely occur within public and SCE existing right-of-way, which will result in minimal disturbance of land and/or airspace. Per the MOS, the improvements would mostly occur on the Project Site (for a new substation) and be limited to new rack relays at the existing Mesa Substation and Newmark Substation. Those relay installations involve minor equipment upgrades and the existing SCE substations and would not require substantial construction that could significantly impact the environment.

In addition, per the MOS, the SCE improvements include the installation of seven (7) to eight (8) tubular steel poles and steel aluminum conductor for the 66 kilovolt (kV) transmission line from the SCE substations and existing powerline infrastructure to the Project. Installation of that equipment would involve minor excavation to place the power poles, support footings, and installation of the related power transmission lines. For the telecom lines, the MOS indicates there will be primary and secondary telecom transmission lines running from the Mesa Substation to the Project. Construction of those underground lines would likely require excavation in the existing right-of-way along portions of Saturn Street, South Orange Avenue, and Potrero Grande Drive. The excavation would be limited to areas needed to install conduit for the telecom lines and a series of new manholes to access the telecom line.

It will take 2-3 days for each electrical pole installation (dig, install footing, pull wire, etc.), and an additional 2-3 weeks for the trenching needed to complete the fiber runs. For conservative purposes, the modeling assumed that the installation of poles and transmission lines were anticipated to occur over a span of 4-6 weeks in 2027. No grading was assumed for the proposed improvement, and only minor excavation is required to install the poles. **Table 1: Offsite Improvement Construction Equipment** shows the construction equipment that will be used over the duration of the installation, the horsepower of the equipment analyzed, as well as how many hours per day the equipment would be used.

Table 1: Offsite Improvement Construction Equipment			
Construction Equipment	**Number of Equipment**	**Horsepower**	**Hours per Day**

3.0 Impact Analysis

Air Quality

Construction-generated emissions associated with the Project were calculated using the California Air Resources Board (CARB) Off-Road Emission Inventory tool emission factors. Using the assumptions above in **Table 1**, specific construction equipment emissions rates for Los Angeles County were pulled. See **Attachment A: Modeling Results** for more information regarding the construction assumptions used in this analysis. Predicted maximum daily construction-generated emissions for the Project are identified in **Table 2: Project Construction Emissions**.

Table 2: Project Construction Emissions						
Calendar Year	**Emissions (pounds per day)[1]**					
	ROG	**NO_X**	**CO**	**SO_2**	**PM10**	**PM2.5**
2025	3.38	52.2	32.4	0.22	9.57	4.02
2026	1.39	11.6	17.9	0.03	1.35	0.69
2027 (Project Emissions)	1.12	6.72	11.3	0.02	1.53	0.49
2027 (Offsite Improvement)[2]	3.88	26.73	27.05	0.10	0.99	0.91
SCAQMD Threshold	*75*	*100*	*550*	*150*	*150*	*55*
SCAQMD Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**
1. Emissions were calculated using the CalEEMod version 2022.1, as recommended by the SCAQMD. Worst-case seasonal maximum daily emissions are reported. 2. Offsite improvement emissions were calculated using CalEEMod Appendix G, Table G-12.						
Source: CalEEMod version 2022.1. Refer to **Attachment A** for model outputs.						

The results of the emissions modeling, as summarized on **Table 2**, show that construction criteria pollutant emissions would remain below the applicable thresholds with construction of offsite improvements, and construction impacts on short-term regional air quality would remain less than significant.

Energy

Per the Project analysis in the IS/ND, construction fuel usage would represent less than 0.002 percent of the County's diesel fuel usage, approximately 0.0004 percent of the gasoline fuel usage, and less than 0.0001 percent of the electricity usage for the County of Los Angeles. Construction modeling for the Project included approximately 38 various pieces of construction equipment. Therefore, the addition of six pieces of equipment would represent a negligible increase in energy usage and would not require increased demand or capacity. Impacts would remain less than significant.

Greenhouse Gas Emissions

As shown in **Attachment A**, GHG emissions during construction of the offsite improvements would result in approximately 124 $MTCO_2e$. These emissions include the conservative assumption of three off-highway truck. In reality, the trucks utilized for this offsite analysis would emit fewer emissions. For the Project, construction emissions ranged from 237 $MTCO_2e$ to 511 $MTCO_2e$ per year. Therefore, the additional emissions would result in a negligible increase, and impacts would remain less than significant.

Noise

Noise would be generated from construction of the offsite improvements, but it would be temporary and not long lasting. Predicted noise from construction of the offsite improvements are shown in **Table 3: Offsite Construction Noise Levels.** This conservatively assumes all four pieces of equipment are operating simultaneously nearest to the sensitive receptor approximately 200 feet north of the Project Site.

Table 3: Offsite Construction Noise Levels

Construction Phase	Receptor Location			Modeled Exterior Noise Level (dBA L_{eq})[2]	Noise Threshold (dBA L_{eq})[3]	Exceeded?
	Land Use	Direction	Distance (feet)[1]			
Offsite Improvements	Residential	North	200	72.0	80	No

1. Distance is from the nearest receptor to the main construction activity area on the Project Site. Not all equipment would operate at the closest distance to the receptor.
2. Modeled noise levels conservatively assume the simultaneous operation of all pieces of equipment.
3. The FTA Noise and Vibration Manual establishes construction noise standards of 80 dBA $L_{eq(8\text{-}hour)}$ for residential uses.

Source: Federal Highway Administration, Roadway Construction Noise Model, 2006. Refer to **Appendix A** for noise modeling results.

As shown in **Table 3** noise levels would not exceed the FTA's maximum 8-hour noise level standards for construction noise of 80 dBA L_{eq} at residential land uses. Therefore, construction noise impacts would remain less than significant. No mitigation measures are required.

4.0 Conclusion

As discussed above, the SCE improvements would be minor and would result in negligible increases in criteria air pollutant emissions, GHG emissions, noise, and energy during Project construction. Impacts would remain less than significant, and no mitigation measures would be required.

Appendix B

Health Risk Assessment Memorandum

Kimley»Horn

MEMORANDUM

To:	Bryan Marsh, CEO, SDCF Monterey Park, LLC
From:	Sophia La Herran, Kimley-Horn and Associates, Inc.
Date:	October 24, 2024
Subject:	1977 Saturn Data Center Project – Construction Health Risk Assessment

1.0 Purpose

The purpose of this Health Risk Assessment (HRA) is to evaluate potential health risks associated with Toxic Air Contaminants (TAC) including Diesel Particulate Matter (DPM) resulting from the construction and operations of the 1977 Saturn Data Project (Project), proposed to be located in the City of Monterey Park (City), California. This HRA was prepared in accordance with the requirements of the South Coast Air Quality Management District (SCAQMD) and guidance from the Office of Environmental health Hazard Assessment (OEHHA) to determine if health risks are likely to occur from the Project.

2.0 Project Location and Description

The Project would be located on an approximately 15.8-acre site (Project Site) at 1977 Saturn Street. The Project Site is bound by residences, a park, a commercial nursery, and water towers to the north, open space to the east, office uses to the south, and office uses and single-family residences to the west. The Project Site is currently improved with a two-story commercial office building that is currently vacant, and an ancillary one-story building.

The Project would demolish and remove the existing improvements and construct a state of the art data center including approximately 218,400 square feet that would include approximately 109,970 square feet of data hall space and approximately 91,889 square feet of support space, which would consist of offices and meeting rooms, employee amenities (such as restrooms, break room, etc.), truck loading and unloading areas, storage areas, mechanical/electrical/fiber entry rooms, and other ancillary uses.

A total of sixty-eight (68) parking spaces would be provided adjacent to the eastern side of the proposed data center buildings, including three handicapped accessible spaces and three spaces for electrical vehicles (EV). The Project would also include two loading dock areas to accommodate deliveries and loading activities for the proposed data center. Vehicular access to the Project Site would be provided via two new gated driveways located along Saturn Street: one along the western perimeter of the Project Site and the other along the eastern perimeter of the Project Site.

Project construction is anticipated to occur as two phases, lasting approximately two years, beginning as early as September 2025 and ending as early as August 2027. For purposes of this environmental analysis, opening year is assumed to be 2027. Grading for the proposed improvements would require cut and fill

to create building pads. Project construction is estimated to require the export of approximately 65,000 cubic yards (cy) of soil material.

3.0 Regulatory Setting

Federal

Federal Clean Air Act

The FCAA was amended in 1990 to address the numerous air pollutants that are known to cause or may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects. 188 specific pollutants and chemical groups were initially identified as HAPs, and the list has been modified over time. The FCAA Amendments included new regulatory programs to control acid deposition and for the issuance of stationary source operating permits.

In 2001, the United States Environmental Protection Agency (U.S. EPA) issued its first Mobile Source Air Toxics Rule, which identified 21 mobile source air toxic (MSAT) compounds as being HAPs that required regulation. A subset of six of these MSAT compounds were identified as having the greatest influence on health and included benzene, 1,3-butadiene, formaldehyde, acrolein, acetaldehyde, and DPM. More recently, the U.S. EPA issued a second MSAT Rule in February 2007, which generally supported the findings in the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission certification standards that must be implemented. Unlike the criteria pollutants, toxics do not have National Ambient Air Quality Standards (NAAQS) making evaluation of their impacts more subjective.

National Emissions Standards for Hazardous Air Pollutants (NESHAPs) were incorporated into a greatly expanded program for controlling toxic air pollutants. The provisions for attainment and maintenance of the NAAQS were substantially modified and expanded. Other revisions included provisions regarding stratospheric ozone protection, increased enforcement authority, and expanded research programs.

Section 112 of the FCAA Amendments governs the federal control program for HAPs. NESHAPs are issued to limit the release of specified HAPs from specific industrial sectors. These standards are technology-based, meaning that they represent the best available control technology an industrial sector could afford. The level of emissions controls required by NESHAPs are not based on health risk considerations because allowable releases and resulting concentrations have not been determined to be safe for the general public. The FCAA does not establish air quality standards for HAPs that define legally acceptable concentrations of these pollutants in ambient air.

Emission Standards for Off-Road Diesel Engines

To reduce emissions from off-road diesel equipment, the U.S. EPA established a series of cleaner emission standards for new off-road diesel engines. Tier 1 standards were phased in from 1996 to 2000 (year of manufacture), depending on the engine horsepower category. Tier 2 standards were phased in from 2001 to 2006. Tier 3 standards were phased in from 2006 to 2008. Tier 4 standards, which generally require add-on emission control equipment to attain them, were phased in from 2008 to 2015. The Tier 4

standards require that emissions of PM and oxides of nitrogen (NO_X) be further reduced by about 90 percent from Tier 3 standards. CARB is currently developing potential amendments to the off-road diesel engine standards, in a Tier 5 rulemaking. The Tier 5 rulemaking aims to reduce NO_X and PM emissions from new, off-road compression-ignition (CI) engines, by an additional 50 percent to 90 percent, compared to what is allowed by today's Tier 4 final emission standards.

State of California

California Air Resources Board

CARB's statewide comprehensive air toxics program was established in 1983 with AB 1807 the Toxic Air Contaminant Identification and Control Act (Tanner Air Toxics Act of 1983). AB 1807 created California's program to reduce exposure to air toxics and sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an airborne toxics control measure (ATCM) for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology (T-BACT) to minimize emissions. CARB also administers the state's mobile source emissions control program and oversees air quality programs established by state statute, such as AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, required to communicate the results to the public in the form of notices and public meetings. In September 1992, the AB 2588 was amended by Senate Bill (SB) 1731 which required facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

Diesel Risk Reduction Plan

The identification of DPM as a TAC in 1998 led CARB to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (DRRP) in October 2000. The DRRP's goals include an 85 percent reduction in DPM by 2020 from the 2000 baseline.[1] CARB estimates that emissions of DPM in 2035 will be less than half those in 2010, further reducing statewide cancer risk and non-cancer health effects.[2] The DRRP includes regulations for cleaner new diesel engines, cleaner in-use diesel engines (retrofits), and cleaner diesel fuel.

Truck and Bus Regulation Reducing Emissions from Existing Diesel Vehicles

On December 12, 2008, CARB approved the Truck and Bus Regulation to significantly reduce particulate matter (PM) and oxides of nitrogen (NO_X) emissions from existing diesel vehicles operating in California. The regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Heavier trucks must be retrofitted with PM filters beginning January 1, 2012, and older trucks

[1] California Air Resources Board, *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles*, October 2000.

[2] California Air Resources Board, *Overview: Diesel Exhaust & Health*, https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health, accessed February 20, 2024.

must be replaced starting January 1, 2015. Effective January 1, 2023, nearly all trucks and buses are required to have 2010 model year engines or equivalent.

The regulation applies to most privately and federally-owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. Small fleets with three or fewer diesel trucks can delay compliance for heavier trucks and there are several extensions for low-mileage construction trucks, early PM filter retrofits, adding cleaner vehicles, and other situations. Privately and publicly owned school buses have different requirements.

Heavy-Duty Vehicle Idling Emission Reduction Program

The purpose of the CARB ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling is to reduce public exposure to DPM and criteria pollutants by limiting the idling of diesel-fueled commercial vehicles including transportation refrigeration units (TRUs). The driver of any vehicle subject to this ATCM is prohibited from idling the vehicle's primary diesel engine for greater than five minutes at any location and is prohibited from idling a diesel-fueled auxiliary power system (APS) for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools). On February 24, 2022, CARB approved amendments to the TRU ATCM (2022 Amendments) to achieve additional emission and health risk reductions from diesel-powered TRUs and increase the use of zero emission technology in the off-road sector. The 2022 Amendments will help meet the State's multiple risk reduction, air quality, and climate goals, as well as the directive of Executive Order N-29-20, which set a goal for 100 percent zero-emission off-road vehicles and equipment in the State by 2035.

CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks, beginning in 2008, requires that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to "neutral" or "park", and the parking brake is engaged.

Section 2485 and Section 2449 of Title 13 of the California Code of Regulations limits diesel-fueled motor vehicle and off-road idling to no more than five minutes. Section 2485 limits idling for diesel-fueled commercial motor vehicles with gross vehicle weight ratings of greater than 10,000 pounds that are or must be licensed to operate on publicly maintained highways and streets within California. Section 2449 limits idling for off-road diesel-fueled fleets.

CalEnviroScreen

OEHHA developed CalEnviroScreen 4.0, which is a mapping tool that helps identify California communities that are most affected by many sources of pollution, and where people are often especially vulnerable to pollution's effects. CalEnviroScreen uses environmental, health, and socioeconomic information to produce scores for every census tract in the State. The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores. According to CalEnviroScreen, the Project Site and the nearest residences to the

north are located within Census Tract 6037482800, which is within the 75th percentile.[3] It should be noted that the CalEnviroScreen scores are relative to other census tracts and are not an expression of health risk, and do not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment.

Executive Order N-79-20

Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency, the California Geologic Energy Management Division (CalGEM), and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by 2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation, which was adopted by CARB in July 2020.

Regional

South Coast Air Quality Management District

The California Clean Air Act (CCAA) provides the SCAQMD with the authority to manage transportation activities at indirect sources and regulate stationary source emissions. Indirect sources of pollution are generated when minor sources collectively emit a substantial amount of pollution. An example of this would be the motor vehicles at an intersection, a mall, and on highways. As a State agency, CARB regulates motor vehicles and fuels for their emissions.

Air Toxics Control Plan

The Air Toxics Control Plan (March 2000, revised March 26, 2004) is a planning document designed to examine the overall direction of the SCAQMD's air toxics control program. It includes development and implementation of strategic initiatives to monitor and control air toxics emissions. Control strategies that are deemed viable and are within the SCAQMD's jurisdiction will each be brought to the SCAQMD Board for further consideration through the normal public review process. Strategies that are to be implemented by other agencies will be developed in a cooperative effort, and the progress will be reported back to the Board periodically.

[3] California Office of Environmental Health Hazard Assessment, *CalEnviroScreen 4.0 Results (October 2021 Update)*, https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40, accessed March 2024.

Multiple Air Toxics Exposure Study

The SCAQMD conducted an in-depth analysis of the toxic air contaminants and their resulting health risks for all of Southern California. The Multiple Air Toxics Exposure Study in the South Coast Air Basin (SoCAB) (MATES V) (August 2021) shows that carcinogenic risk from air toxics in the SoCAB, based on the average concentrations at the 10 monitoring sites, is approximately 40 percent lower than the monitored average in MATES IV and 84 percent lower than the average in MATES II.

MATES V is the most comprehensive dataset documenting the ambient air toxic levels and health risks associated with the SoCAB emissions. Therefore, MATES V study represents the baseline health risk for a cumulative analysis. MATES V estimates the average excess cancer risk level from exposure to TACs is 424 in one million basin wide. In comparison, the MATES IV basin average risk was 897 per million. These model estimates were based on monitoring data collected at ten fixed sites within the SoCAB. None of the fixed monitoring sites are near the Project Site. However, MATES V has extrapolated the excess cancer risk levels throughout the SoCAB by modeling the specific grids. MATES V modeling predicted an excess cancer risk of 549 in one million for the Project area.[4] DPM is included in this cancer risk along with all other TAC sources. DPM accounts for a majority of the total risk shown in MATES V in this area.

4.0 Health Risk Analysis

Health Risk Analysis Threshold

Project health risks are determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. While the final determination of significance thresholds is within the purview of the lead agency pursuant to the State CEQA Guidelines, the SCAQMD recommends that the following air pollution thresholds be used by lead agencies in determining whether the impacts from the Project are significant. If the lead agency finds that the Project has the potential to exceed the air pollution thresholds, the Project should be considered significant. The thresholds for air toxic emissions are as follows.

- **Cancer Risk:** Emit contaminants that equal or exceed the maximum individual cancer risk of 10 in one million.
- **Cancer Burden:** Emit contaminants that exceeds the cancer burden of 0.5 excess cancer cases (in areas that equal or exceed one in one million).
- **Non-Cancer Risk:** Emit contaminants that equal or exceed the maximum hazard index of 1.0.

Cancer risk is expressed in terms of expected incremental incidence per million population. As noted above, the SCAQMD has established an incremental increase rate of less than 10 in one million as the maximum acceptable incremental cancer risk due to TAC exposure. This risk would be in addition to any cancer risk borne by a person not exposed to these TACs. This threshold serves to determine whether or

[4] South Coast Air Quality Management District, *MATES V Estimated Risk*, https://experience.arcgis.com/experience/79d3b6304912414bb21ebdde80100b23/page/home/?views=view_38%2Cview_1#data_s=id%3AdataSource_105-a5ba9580e3aa43508a793fac819a5a4d%3A282, accessed March 2024.

not a given project has a potentially significant development-specific and cumulative impact. To put this risk in perspective, the existing risk of contracting cancer from all airborne air toxics in the vicinity of the Project Site is 549 in a million which is 55 times more than the SCAQMD's threshold of 10 in one million.[5]

The SCAQMD has also established non-carcinogenic risk parameters for use in HRAs. Noncarcinogenic risks are quantified by calculating a "hazard index," expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A hazard index of less than 1.0 means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less than significant.

4.1 Potential Health Risk Impacts

CARB identified DPM as a TAC in 1998. Mobile sources (including trucks, buses, automobiles, trains, ships, and farm equipment) are by far the largest source of diesel emissions. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Diesel exhaust is composed of two phases, either gas or particulate – both contribute to the risk. The gas phase is composed of many of the urban TACs, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, and polycyclic aromatic hydrocarbons. The particulate phase has many different types that can be classified by size or composition. The sizes of diesel particulates of greatest health concern are fine and ultrafine particles. These particles may be composed of elemental carbon with adsorbed compounds such as organics, sulfates, nitrates, metals, and other trace elements. Diesel exhaust is emitted from a broad range of on- and off-road diesel engines. As shown in **Figure 1: Sensitive Receptor Locations,** the Project Site boundary is approximately 65 feet from existing sensitive receptors (single-family residences). This report includes an analysis of DPM and was performed using the U.S. EPA-approved AERMOD model. See **Attachment A: AERMOD Modeling and Exposure Assumptions**.

NOT TO SCALE

Kimley»Horn

Construction Carcinogenic Risk

Construction-related activities would result in Project-generated emissions of DPM from the exhaust of off-road, heavy-duty diesel equipment for site preparation (e.g., clearing, grading); paving; application of architectural coatings; on-road truck travel; and other miscellaneous activities. For construction activity, DPM is the primary toxic air contaminant of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors.

Table 1: Construction Carcinogenic Risk Assessment shows the health risk for the construction of the Project. The analysis calculates risk based on exposure to construction concentrations during the entire two-year construction period.

Table 1: Construction Carcinogenic Risk Assessment

Exposure Scenario	Cancer Risk (Risk per Million)[1]	Significance Threshold (Risk per Million)	Exceeds Significance Threshold?
Residential Receptors	2.49	10	No
Worker Receptor	0.11	10	No

1. The reported annual pollutant concentration is at the closest maximally exposed individual resident (MEIR) to the Project Site.

Source: Refer to Attachment B: Modeling Data.

As shown in **Table 1**, the construction risk at residential and worker receptors would be 2.49 in one million and 0.11 in one million, respectively. The incremental cancer risk would be less than those levels at distances further from the Project Site. As such, the maximum cancer risk would be far below the SCAQMD threshold of 10 in one million, and impacts associated with carcinogenic risk would therefore be less than significant.

Table 2: Population Construction Cancer Burden shows the population cancer burden for the construction of the Project.

Table 2: Population Construction Cancer Burden

Burden	Significance Threshold	Exceeds Significance Threshold?
0.0002	0.5	No

Source: Refer to Attachment B: Modeling Data.

According to OEHHA, cancer burden, defined as the number of increased cancer cases expected in a population of one million, is used to assess public health impacts on a larger scale. Emissions of Project-generated DPM disperses, and concentration dissipates, rapidly with distance from the Project Site boundary. The residential receptors in Figure 1 are closest to the Project Site and would be the maximum receptor locations during construction.

In addition, **Figure 2: Zone of Impact Screening Isopleth Map** provides a zone of impact screening isopleth that illustrates where total excess lifetime cancer risk exposure could be greater than 1 in 1,000,000, which is the screening criteria per OEHHA and SCAQMD for further analysis of the total cancer burden.

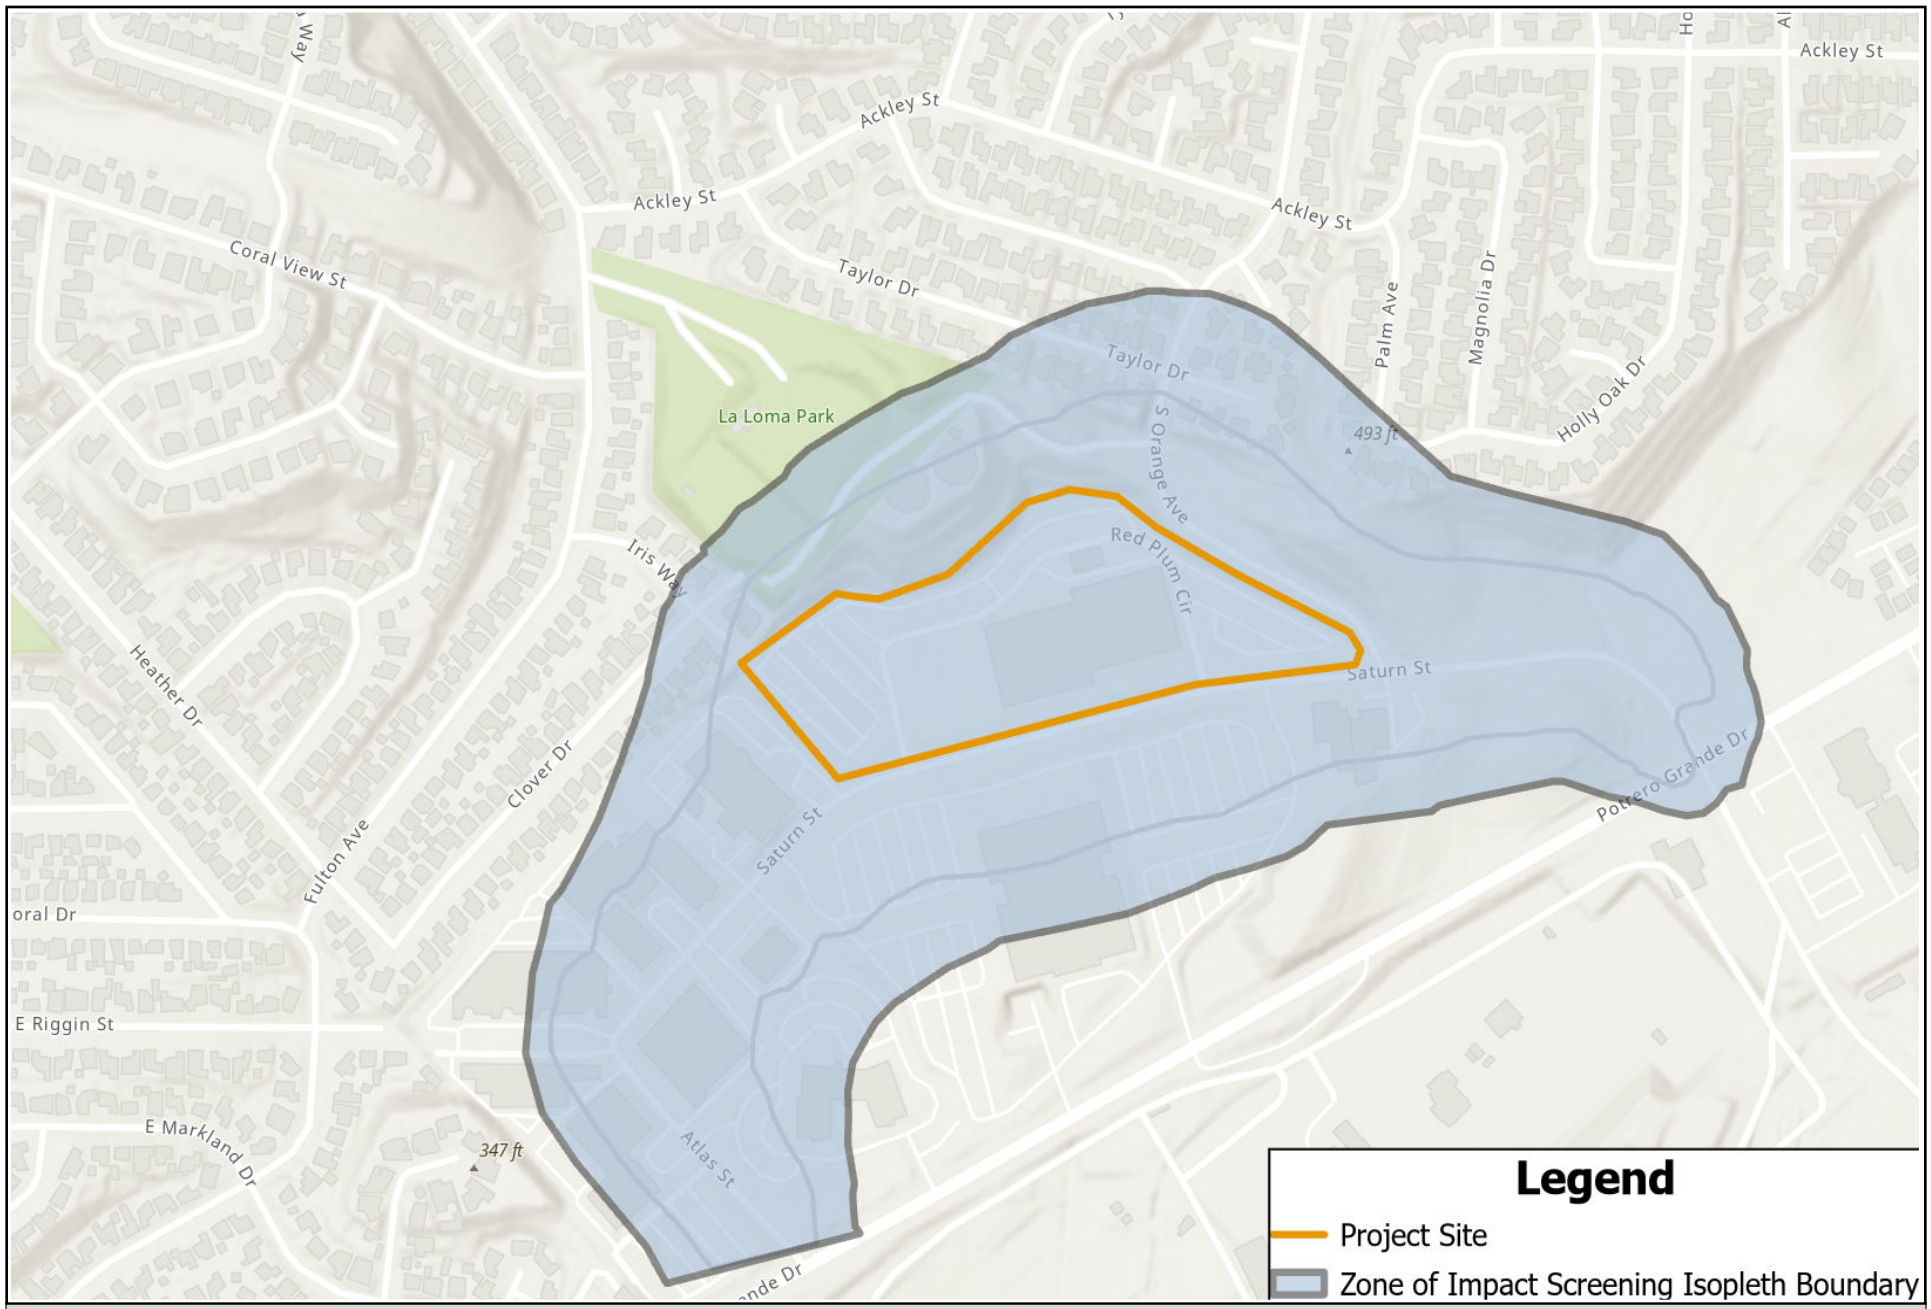

FIGURE 2: ZONE OF IMPACT SCREENING ISOPLETH MAP
1977 Saturn Data Center Project

NOT TO SCALE

Kimley»Horn

To be clear, this isopleth is highly conservative because it identifies the zone of potential impact over a 70-year lifetime exposure, and the Project construction duration is only approximately two years. Nonetheless, this report quantitatively analyzed the cancer burden within the zone of impact. As shown in Figure 2, the cancer burden for all receptors within the isopleth outline is well below the applicable SCAQMD threshold.

Quantitatively, the total cancer burden is the product of the number of persons in a residential population area and the estimated individual risk. As shown in Table 2, total cancer burden would be 0.0002, which is far below the SCAQMD's 0.5 cancer burden threshold. In addition, this modeled exposure scenario is temporary and ceases upon construction completion. Therefore, community-wide exposure to TACs from the Project would not result in a cancer burden of 0.5 or greater, and impacts would be less than significant.

Construction Non-Carcinogenic Hazard

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. RELs are designed to protect sensitive individuals within the population. According to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system.[6]

Chronic non-carcinogenic impacts are shown in **Table 3: Construction Chronic Hazard Assessment**. A chronic hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the chronic exposure by the reference exposure level. The chronic hazard was calculated based on the highest annual average concentration at the maximally exposed individual receptor. It should be noted that there is no acute REL for DPM and acute health risk cannot be calculated. The highest maximum chronic hazard index associated with DPM emissions from Project construction would be 0.0030 and 0.0021 at the residential and worker receptors, respectively. Therefore, construction non-carcinogenic hazard would not exceed the acceptable limits of 1.0 and impacts would be considered less than significant.

Table 3: Construction Chronic Hazard Assessment

Exposure Scenario	Annual Concentration (µg/m³)[1]	Chronic Hazard
Residential Receptors	0.0150	0.0030
Worker Receptors	0.0150	0.0021
SCAQMD Threshold	*N/A*	*1.0*
Threshold Exceeded?	**N/A**	**No**

1. The reported pollutant concentration is at the closest receptor (maximally exposed individual receptor).

Source: Refer to Attachment B: Modeling Data.

[6] California Office of Environmental Health Hazard Assessment, *OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary*, https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary, accessed March 2024.

Operational Health Risk Analysis

Operational emissions from the Project would result from mobile sources (i.e., motor vehicle use) and area sources (such as the use of landscape maintenance equipment, consumer products, and architectural coatings). As discussed in the Air Quality Assessment, the majority of these emissions would be generated by diesel and gasoline-powered vehicle travel occurring off-site from light-duty vehicles trips by staff to and from the Project Site. Light duty vehicles are not substantial sources of TAC emissions (e.g., DPM), which are primarily associated with diesel fueled vehicles.

The proposed Project would include up to 12 4-MW stationary emergency diesel generators upon loss of grid power. As discussed in the *1977 Saturn Data Project – Air Quality Analysis* (Kimley-Horn, April 2024), as part of the regulatory compliance process, the Applicant will obtain Permits to Operate (PTO) from the SCAQMD prior to installation or operation of the emergency generators, which verifies that the generators meet the applicable Best Available Control Technology (BACT) requirements and comply with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) and Rule 1401 (New Source Review of Toxic Air Contaminants), which would minimize TAC emissions. An operational health risk analysis would be required to comply with SCAQMD's Rule 1401 permit requirements. DPM emissions and cancer risk associated with the proposed diesel generators would be analyzed within the required SCAQMD permit to ensure that associated emission levels remain less than significant.

Conclusion

As described above, impacts related to cancer risk would be less than significant. Additionally, non-carcinogenic hazards are calculated to be within acceptable limits. It should be noted that the impacts assess the Project's incremental contribution to health risk impacts, consistent with the SCAQMD guidance and methodology. The SCAQMD has not established separate cumulative thresholds and does not require combining impacts from cumulative projects. The SCAQMD considers projects that do not exceed the project-specific thresholds to generally not be cumulatively significant.[7] Therefore, impacts related to health risk from the Project would be less than significant.

Mitigation Measure: No mitigation is required.

Level of Significance: Less Than Significant Impact.

AERMOD Modeling and Exposure Assumptions

AERMOD Modeling and Exposure Assumptions

Meteorological Data. AERMOD requires hourly meteorological data consisting of wind vector, wind speed, temperature, atmospheric stability, and mixing height. The latest 5-year meteorological data set for the Pico Rivera Monitoring Station was obtained from the SCAQMD. Surface and upper air meteorological data from this station was selected as being the most representative for meteorology based on proximity to the Project site, as well as terrain, surrounding land uses, and surface characteristics.

Receptor Grid. To identify the maximum impacted sensitive receptors, a uniform Cartesian grid was placed over the sensitive receptors in the Project site's vicinity. According to the SCAQMD, a grid spacing of 50 meters or less must be used to identify the maximum impacted receptors (i.e., peak cancer risk and peak hazard indices).[1] Given the Project site's size, sensitive receptors were modeled with a maximum of 50-meter grid spacing.

Terrain Characteristics. As recommended by the SCAQMD, the United States Geological Survey (USGS) National Elevation Dataset (NED) terrain data was imported into AERMOD.

Averaging Times. AERMOD was run to obtain the unitized (i.e., 1 g/s) peak 1-hour and annual average (period) concentration in micrograms per cubic meter ($\mu g/m^3$) of PM_{10} at the nearby sensitive receptors. Estimated emissions were multiplied by the dispersion factors to obtain concentrations.

Project Sources.

Cancer Risk. Based on the OEHHA methodology, residential inhalation cancer risk from annual average DPM concentrations are calculated by multiplying the daily inhalation dose, cancer potency factor, age sensitivity factor (ASF), frequency of time spent at home, and exposure duration divided by averaging time, yielding the excess cancer risk. These factors are discussed in more detail below. It is important to note that exposure duration is based on continual heavy truck operation along nearby roadways. Exposure through inhalation (Dose-air) is a function of breathing rate, exposure frequency, and concentration of substance in the air. To estimate cancer risk, the dose was estimated by applying the following formula to each ground-level concentration:

$$\text{Dose-air} = C_{air} * (BR/BW) * A * EF * 10^{-6}$$

Dose-air = dose through inhalation (mg/kg/day)
C_{air} = air concentration ($\mu g/m^3$) from air dispersion model
(DBR/BW) = daily breathing rate normalized to body weight (L/kg bodyweight-day)

[1] 18. South Coast Air Quality Management District, SCAQMD Modeling Guidance for AERMOD, http://www.aqmd.gov/home/air-quality/meteorological-data/modeling-guidance.

A = inhalation absorption factor (unitless)
EF = exposure frequency (approximately 350 days per year for residential)
10^{-6} = conversion factor (micrograms to milligrams, liters to cubic meters)

OEHHA developed ASFs to consider the increased sensitivity to carcinogens during early-life exposure. In the absence of chemical-specific data, OEHHA recommends default ASFs presented in the Exposure Assumptions Table, below. Fraction of time at home (FAH) during the day is used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. OEHHA recommends the FAH values presented in the table.

Exposure Assumptions

Scenario	Age	Exposure Frequency (days/year)	Exposure Duration (years)	Age Sensitivity Factor[1] (ASF)	Fraction of Time at Home (FAH)	Daily Breathing Rate (L/kg BW-day)[2]
Construction	**Residential**					
	Third trimester	350	0.25	10	85%	361
	0 to 2 years	350	1.75	10	85%	1,090
	Ages 2 through 8 years	350	7	3	72%	631
	Ages 9 through 15 years	350	0.5	3	72%	572
	Ages 16 and greater	350	0	1	73%	261
	Worker	250	9.5	1	N/A	230

1. Accounts for potential increased sensitivity to carcinogens during childhood.
2. Daily breathing rate normalized to body weight (L/kg body weight - day) (95th percentile for 3rd trimester to 2 years and 80th percentile for other age groups). Worker breathing rates are 95th percentile 8-hour breathing rates based on moderate intensity activity.

Source: California Office of Environmental Health Hazard Assessment, *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments*, February 2015.

To estimate the cancer risk, the dose is multiplied by the cancer potency factor, the ASF, the exposure duration divided by averaging time, and the frequency of time spent at home (for residents only):

$$Risk_{inh\text{-}r} = (Dose_{air} * CPF * ASF * (ED/AT) * FAH)$$

$Risk_{inh\text{-}res}$ = residential inhalation cancer risk (potential chances per million)
$Dose_{air}$ = daily dose through inhalation (mg/kg-day)
CPF = inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
ASF = age sensitivity factor for a specified age group (unitless)
ED = exposure duration (years)
AT = averaging time of lifetime cancer risk (years)
FAH = fraction of time spent at home (unitless)

Chronic Non-Cancer Hazard. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. For example, according to OEHHA, the chronic REL for DPM is

5 and the target organ is the respiratory system.[2] The following equation was used to determine the non-cancer risk:

$$\text{Hazard Index} = C_i/REL_i$$

C_i = concentration in the air of substance i (annual average concentration in $\mu g/m^3$)
REL_i = chronic noncancer Reference Exposure Level for substance ($\mu g/m^3$)

Health Risk Computation. A health risk computation was performed to determine the risk of developing an excess cancer risk calculated on a 30-year exposure scenario using the approach described in the OEHHA *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments* (February 2015) and the daily breathing rates, age sensitivity factors, exposure duration, and fraction of time at home. Health risks were analyzed at the point of maximum impact and are a conservative estimate. The pollutant concentrations are then used to estimate the long-term cancer health risk to an individual as well as the non-cancer chronic health index.

The off-site impacts would occur from the diesel trucks accessing the proposed Project. The cancer and chronic health risks are based on the annual average concentration of PM_{10} (used as a proxy for DPM). As noted above, the chronic and carcinogenic health risk calculations are based on the standardized equations contained in the U.S. EPA *Human Health Evaluation Manual* (1991) and the OEHHA Guidance Manual (2015). The health risk computation was performed to determine the risk of developing an excess cancer risk calculated on these worst-case exposure duration scenarios. The chronic and carcinogenic health risk calculations are based on the standardized equations contained in the OEHHA Guidance Manual. Only the risk associated with the worst-case location of the Project was assessed.

[2] California Office of Health Hazard Assessment, OEHHA Acute, *8-hour and Chronic Reference Exposure Level (REL) Summary*, 2020. https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary)

Introduction

Background

The project site is located in a commercial area of the City of Monterey Park at 1977 Saturn. SDCF Monterey Park is planning to reconfigure the site and the existing building. The site has been empty since about 2016, but the irrigation system is currently functioning. SDCF has asked Arborgate Consulting to evaluate and document the existing trees within the property lines. All the existing trees on this property are included in this study.

Assignment

Arborgate Consulting was asked to provide review and arboricultural evaluation of about 340 trees' health and condition, professional opinions on their preservation, and report as appropriate for the City of Monterey Park. Each tree 4-inch caliper or larger was to be measured and evaluated for health and structural quality for inclusion in this report. Photographs to illustrate typical conditions and setting will be included in the appendix. Recommendations by this consultant the landscape architect will be included for retention or removal, and for necessary construction clearance. This version of the report includes recommendations from Chris Ford the landscape architect.

Observations

General Conditions

This site is currently vacant and has been since about 2016. The site was built out almost 45 years ago in 1979. The property is being maintained and irrigated, but with no activity within the building. The building is two story and the size is 205,628 square feet. The building and 847 stalls of parking are set on a 15.83-acre site.

The parking lot tree pallet is dominated by carrotwoods, *Cupaniopsis anacardioides;* and cultivars of London plane tree, *Platanus x Hispanica*, that nearly surround the building. The main species on the surrounding project edges are eucalypt species, *Eucalyptus sideroxylon* and *Corymbia citriodora*, formerly *Eucalyptus citriodora*. Brazil peppers, *Schinus terebinthifolius,* sprout up as weeds among the trees on the edges of the surrounding slopes and landscape areas. Most of these are smaller than would be expected after 45 years, but most are constrained by hard pruning and the small root space in parking islands. As would be expected, the curbs adjoining and surrounding these trees have been damaged despite frequent pruning to control the size of these trees. Due to years of hard low-bid pruning, most of the trees have weak structure and some are falling apart. The parking lot planting spaces are a mixture of small square planters and end-cap island planters The small square planters do not have root barriers installed, but the carrotwoods' health is still failing due to lack of root space. The image on page 4 shows the general location of tree species.

The west edge of the site is delineated by a row of red ironbark, *Eucalyptus sideroxylon*, that are crowded and untrained. Several have died.

The street trees along Saturn east of the entry are larger cultivars of southern Magnolia, *Magnolia grandiflora cv*. Most are healthy, but being outside the fence, they are not included in the scope of this report. West of the entry there are sycamores along the street, possibly street trees, they are included in the report.

The preponderance of species planted here are carrotwoods and sycamores. There are 97 carrotwoods, 96 lemon gums, 55 red ironbarks, 37 London planes, 33 California sycamore, 13 magnolias and 10 Chinese elms. In many circles this would be considered mono-cultures. Of the 337 trees, 29.6% are carrotwoods, 29.4% are lemon gums, and 16.8% are red ironbark. Urban foresters often state that no more than 5% of the community plant pallet should be of one species. Being subject to many common ailments, the combined Platanus species come to 21.4%. This would mean that if a pest or disease infested or infected one of the main tree species, it could mean a significant loss of this site's tree canopy.

All, or nearly all, the elms, red ironbarks and lemon gums can be preserved because they are out of the way of improvements, but it looks like most and nearly all carrotwoods should be removed.

Due to the small size of the square parking islands, and the shallow rooted nature of this species, the carrotwoods planted there have significant dieback, are chlorotic and running out of root space. Soil chemistry has declined.

There are no rare or endangered species on site. Only one of the tree species is native or naturally occurring in California. None of these trees are naturally occurring on this site.

General Location of Tree Species

Pruning

As one way to reduce costs and slow down the growth of the trees, hard pruning, including topping and heading have been used. Trees in the small parking lot planters are equivalent to the urban trees in small sidewalk cutouts. One study published in American Forests magazine said that nationwide the average lifespan of urban trees is just seven years. The same article said that Los Angeles claims to have seventeen years of lifespan for their urban trees.

Trees with less foliage area grow slower than those allowed to grow naturally and unimpeded. However, the roots, trunks and limbs *must* increase in diameter or die. Parking lot trees are essentially potted plants, the ones with root barriers even more so.

There is a way to keep trees smaller by pruning, but it takes more knowledge, time and thought. The low-bid type of pruning found on this site is as common as the desire to save money, but now more trees have another reason to be removed. Not only do they have inadequate root space, but now their structure is beginning to fall apart and unless they are pruned more frequently, there will be more limb or branch failures. The carrotwoods in east front lot were headed back severely and probably in the wrong season. As a result, many got sun burned trunks, decay and dead branches around their canopies.

Heading cuts have created brushes of sprouts and growth just behind the pruning cuts, and the dominant sprouts become awkward doglegs. No training was done to properly space the main limbs and if they were growing better, the crowded limbs would begin to pinch each other out. Bark has been trapped between these limbs, further weaking their attachment. Now many of these limbs are also growing too long and with the brush of growth created by heading, are end heavy…i.e. not good trees to park under. This is why California State Government Code 53067 so strongly decries topping and heading.

> *"Topping is the practice of cutting back large diameter branches of a mature tree to stubs and is a particularly destructive pruning practice. It is stressful to mature trees, and may result in reduced vigor, decline, or even death of trees. In addition, new branches that form below the cuts are only weakly attached to the tree and are in danger of splitting out. Topped trees require constant maintenance to prevent this from happening and it is often impossible to restore the structure of the tree crown after topping."*

All or nearly all text books on arboriculture and pruning standards, e.g., ANSI A300 also warn against topping and heading.

A number of the red ironbarks behind the building were poorly trained. Codominant limbs with included bark is a common reason for limb failure. This species has unusually thick bark for a eucalypt. When the bark is included or trapped between limbs, it is more of a weakness than the same defect in other species.

Many of the London plane trees around the west lawn area had poorly made pruning cuts. They were too flush to the trunks. This is another issue that all pruning standards and guides warn against. A large number of trees in this area are declining, and a number have serious decay issues.

Soil Management

The two main related issues regarding soil management are compaction and turf management. Roots simply cannot penetrate soil compacted more than 300 PSI, (pounds per square inch) and resist penetration at compaction levels over 150 PSI. When the parking areas are graded and compacted, then the parking islands are built, the landscape contractors dig planting holes into the islands and square planters, but do not loosen the whole planter. As a result the roots are confined into much less space than trees need.

All the trees growing around the lawns here are shallow or very shallow rooted. Lawn areas are rototilled, at most loosening the top six inches. The lawns are then mowed and irrigated frequently. If you want to compact soil, you moisten it and roll back and forth over it. The west lawn area was soggy wet. Weekly the lawn mowers roll back and forth on wet or moist soil, and gradually that 6-inch deep area is compacted. The roots never were able to grow deeper than six-inches, and then that is reduced. So, trees in turf are shallow rooted. Then as the roots grow in diameter and stick up above the surface the lawn mowers injure them more and more. Many, if not most of the trees now in or previously in lawn areas have been injured by lawn maintenance equipment. Those injuries frequently lead to decay, and the decay can spread into the base of the tree. Turf is fertilized more than trees need and with much more nitrogen than trees should have. This weakens their wood and increases the length of their branches – not a good combination.

These factors conspire to reduce longevity of the trees. But now this site will be reconfigured and most of the site trees should be removed. Despite the shorter life spans from poor maintenance practices, most of the trees will go to a land fill or be ground and become mulch for the new smaller landscape area anyway.

They have all served their useful life span and are in decline. There are few if any of these trees that are worth transplanting.

Abbreviations in Matrix

The size, species, evaluation of health, structural condition, location, and the description of defects, health and condition of the trees are listed below. Arboricultural terms are defined in the glossary.

Abbreviations used in the following matrix include:

1s = one sided
1sRF = one-sided root flare
2long = too long
brk = broken limb
Chlor = chlorotic
Cod = codominant branching
Cr = crowded
Crk = cracked
CrS = crowded scaffold limbs
CrR = crowded roots
cv = cultivar
Db = dieback
Dk = decay
DKB = decayed base
DKT = decayed trunk
DL = dog-leg scaffolds
DLT = dog-leg trunk
Epi = epicormic shoots
FC = flush cuts
Hd = headed
Inc = included bark
LB = low branched
Lt = lion-tailing
noRF = no visible root flare
OL = over-lifted
OP = over-pruned
mSp = slightly sparse
Sp = sparse
Sh = shallow roots
SS = sunscald bark
Sup = suppressed crown class
SW-lift = sidewalk lifted
T = trunk
T-bow = bowed trunk
TD – tear down
Tinj = trunk injury
TO = limb tear out
Topd = topped
TTgird = trunk girdled by tree ties
Xing = crossing, rubbing limbs

Tree Evaluation Details

Carrotwood trees, *Cupaniopsis anacardioides.*

Ninety seven of the trees are carrotwood trees, originally promoted by Sunset Western Garden Book as a good tree to plant by your swimming pool and a good parking lot tree. New communities, like Irvine, jumped on the bandwagon and planted many in small planting spaces without looking at older trees in botanic gardens or older communities. Unfortunately, they are neither clean nor safe near paving. Once they are sexually mature, they drop large amounts of seed, and their shallow roots are almost as hard on paving as Ficus.

The soils and/or the lack of root space may be the cause of their chlorosis. Also, the heavy pruning to keep them from outgrowing their planters could also cause chlorosis, due to related dieback in the roots. Timing may also be a factor. Like most sub-tropical species, carrotwoods should be pruned in late spring or early summer. Unfortunately, all this pruning did not correct the more serious structural defects in these trees. Crowded scaffold limbs, especially with included bark, are apt to split out or pinch each other out. Their pruning also included some topping and heading, which causes epicormic branching and weak branching as well.

In the parking lot, the soil surrounding the islands and under the paving is compacted to 90% or more and not conducive to root growth. As a result, either the roots stay in the confined planter soil and/or they grow in a thin layer between the curbs, asphalt, and soil below.

Red ironbark, *Eucalyptus sideroxylon*

Of all the eucalypts common to southern California, I know of none that have such poor structure. I don't know their Designer's intent, but the thick bark is probably better protection in fires. However, the thick bark often gets trapped in the narrow crotches common to this species. The public fear of eucalypts includes many species that don't have such problems. This common fear of eucalypts may be one reason all the red ironbarks were topped. It may also have to do with how high the tree service's lift truck can reach. Regardless, the severe topping here has killed several red ironbarks and ruined the others.

Lemon gum, *Corymbia citriodora*

Many of the lemon gums were also lion-tailed, over-lifted and/or over-pruned. This species can make a fine large landscape specimen, but now they will need much better and much more frequent pruning to control the sprout growth and restore a stronger architecture. Many have weak health and sparse foliage. Part is due to over-pruning and part is probably due to the lemon gum psyllid.

The strength and beauty of their structure will take years of corrective pruning to restore. The first thing to restore is their health. Then a tree service that understands corrective pruning can begin to restore their structure. Until they are healthy again, pruning should be delayed. A tree service that understands corrective will cost much more that the tree service that ruined them.

The eucalypts and elms on this north, east and west slopes will probably be able to remain and be mostly unaffected by construction. Ensuring proper irrigation and treatment of psyllids will be needed going forward.

London plane tree, *Platanus x Hispanica*

London plane trees can be a good lawn tree. Many of the ones on site have been limbed up too soon and too hard. The sudden exposure of the trunk to more sun has sun scalded several of their trunks. The pruning cuts were flush, which damages the branch collar. A number by the edge of the lawn area have decayed trunks due to flush cuts. Also many around the lawn are retaining dead leaves. This is a sign of declining health. The lawn area is very wet, which increases the odds of root rot diseases, aka water molds. About the only healthy ones with adequate to fair structure are in the landscaping in front of the building. Those are the few with a dominant central leader. Lawn mower damage has also blighted many of these trees.

California sycamore, *Platanus racemosa*

Sycamores also can be a good lawn tree. For some unknown reason they do not seem to have kept a dominant central trunk. This species is one of the main ones to be attacked by the invasive shot-hole borers. It also tends to have more anthracnose than the London plane tree. On this site it looks like they have been mixed in with London plane trees. Also, sometimes they hybridize. If they did not have seed heads, I had a hard time identifying one from the other this time of year. London plane trees only have one or two balls to each cluster and their leaves are more tomentose. California sycamore has three or four seed ball per cluster. Usually, the sycamore grows much faster than the London plane tree. So the larger Platanus are probably sycamores.

Chinese elm, *Ulmus parviflora*

The Chinese elms are located at the top of the west slope, under power lines. Line clearance pruning has not been good to these trees. No sign of elm anthracnose was seen. To avoid more line clearance pruning, and the ugly effect on the trees, directional pruning should be used to help keep them growing away from the lines.

This species, like the Brazil pepper, can become a weed. So maintenance people should be able to recognize it and remove them before the grow to larger sizes. Both can sucker or root sprout, so they should be treated with herbicide immediately after cutting.

Photographic Documentation

Red ironbarks #7 to 12

Red ironbarks #16 & 18 are dead

Chinese elms #32 to 37 are in back. Lemon gums #23, 39 and 45 are in front

Carrotwoods #113 to 130 in front. Red ironbarks behind on the hill. Note sunscald on the carrotwood in front

Looking east through the carrotwoods. Not the small growing space

Lemon gums 45 to 54. Note the sparse foliage

Carrotwood #151 – note sunscald

Carrotwood #155 – note sunscald

Lemon gums #69, 70 & 71 at right. Red ironbark #72 up the hill.

Lemon gums #73, 75, 76, 79, 80, 83 & 84, with red ironbarks behind

Lemon gums 90, 91, 92, and 94. Red ironbarks #89, 95, 96 & 97 behind.

Lemon gums #261 to 273 (right to left)

Lemon gum #312. This is what they should look like.

Lemon gums #316 to 318 in front, #320 in back

California sycamore #180 with decay at base, needs decay testing.

London plane trees #188, 189 & 190 – note retained dead leaves.

Platanus #170 to 179

Platanus #169 to 176 (right to left)

Platanus #158 to 168 (right to left)

Platanus #158 to 162

Platanus #229 to 238 (right to left)

Analysis

Of the 337 trees in the scope of this report, the two most common species are the carrotwood and lemon gum. The most common in the parking lot is the carrotwood. The most common tree around the site edges is the lemon gum.

All, or nearly all, the elms, red ironbarks and lemon gums can be preserved because they are out of the way of improvements, but it looks like most and nearly all carrotwoods should be removed.

The following Matrix of Recommendations will list the trees that should be removed for health and structural condition reasons. Magnolias along Saturn need to be removed and replaced for the new road dedication and new sidewalk. Elms under the wires across the top edge of the site need to be removed for the electrical easement. Some trees out of the path of construction with a "C-" rating may be retained with appropriate professional correction measures. The owners or managers will need to decide if such lower quality trees are worth the necessary three or four years of corrective pruning to restore them to a more sound condition.

Since the carrotwoods are the predominant species, and it is hard to find well trained specimens from nurseries, spot replacements with specimen box size trees may not produce lasting results. Starting with smaller trees, like 5 or 15 gallon contain size, is more conducive to training. However, typical landscape maintenance personnel are not trained in training trees. Therefor replacement with another species may be the best plan.

Another plan would be to hire a board certified master arborist or registered consulting arborist to provide specifications for training and oversee the training.

Recommendations

Removals and Retention

This consultant is not aware of which trees along Saturn are City street trees. City streets are controlled by the City, and permission to remove those along Saturn for the new road and sidewalk alignment must be obtained, as soon as practical. Not being sure of the season the work will be done, in this instance, for all City trees to remain, I recommend a foot of clearance from the trunk for every for every inch of caliper.

There are few carrotwood trees worth going to extra trouble to protect and preserve during construction. Besides damage done by poor pruning, they were a poor choice in the first place. Some people may suggest transplanting them to other places. However, transplanting of trees in the path of construction to other places on site is not recommended. Their structural condition and shallow roots reduce their value, their health reduces their survival rate, and transplanting cannot be justified on a cost versus value basis, and there is no known need for them elsewhere on this site.

The Brazil peppers around the north edges are small bushy weeds and so outside the scope of this report. They should be removed as soon as possible. They are likely to root-sprout when cut down and when their roots are cut or damaged. The roots of pepper trees removed should be removed as much as reasonable. A common practice is to paint the stump

of peppers cut down with Round up or Garlan herbicide right after cutting, within three minutes of cutting. The Chinese elms under the power lines, are also prone to sprouting after being cut down.

Eucalyptus seldom transplant successfully. There is no reason to try to transplant any of them. All the red ironbark and lemon gums are outside the work area. There are more than enough eucalypts and there is no reason to keep any that are suppressed or in really poor health.

In this current version of the report, with 27 additional removals included, a total of 186 trees need to be removed.

Protection of Existing Trees to Remain

If existing trees designated to remain are damaged during construction, the Contractor shall replace such plants of the same species and size as those damaged (as reasonable) at no cost to the owner. Determination of extent of the damage and the value of damaged plants shall rest solely with this consultant or the owner's representative. Value loss will be calculated using the method established by the Council of Tree & Landscape Appraisers, 10th edition of The Guide for Plant Appraisal. Determination of whether to accept compensation through plant replacement or monetary settlement shall rest solely with the owner.

Before removals begin, all the trees shall be clearly marked for removal or retention, and written instructions given to the contractor. Ideally, the contractor, arborist and owner's representative should meet to discuss the removal and marking.

Protection Barrier: Protection barriers shall be installed around trees to be preserved. The barriers shall be constructed of secure chain-link fencing. The barrier shall be placed as far from the base of the tree(s) as possible, at least 1-foot per inch of trunk diameter and beyond the drip-line. The fencing shall be maintained in good repair throughout the duration of the project, and shall not be removed, relocated, or encroached upon without permission of the arborist involved. The City street trees shall be protected according to City requirements and standards.

Storage of Materials: There shall be NO storage of materials or supplies of any kind within the area of the protection barriers. Concrete and cement materials, block, stone, sand and soil shall not be placed within the drip-line of the tree.

Fuel Storage: Fuel storage shall NOT be permitted within 150 feet of any tree to be preserved. Refueling, servicing and maintenance of equipment and machinery shall NOT be permitted within 150 feet of trees to remain.

Debris and Waste Materials: Debris and waste from construction or other activities shall NOT be permitted within protected areas. Wash down of concrete or cement handling equipment, in particular, shall NOT be permitted within 150 feet of protected trees.

Planting near Trees Designated for Protection: Any digging within designated protection zones shall done using supersonic air (AirSpade or AirKnife) directly as the digging medium, by means of a nozzle, whose nominal rated input pressure (available from manufacturer's literature) must not exceed 130 psig (pounds per square inch at gage) unless otherwise approved. Nozzles designed for input above 130 psig can damage fine roots and are not recommended. Air compressors rated between 100 to 125 psig recommended.

Grade Changes: Any grade changes proposed should be approved by a Registered Consulting Arborist before construction begins, and precautions taken to mitigate potential injuries. Grade changes can be particularly damaging to trees. Even as little as two inches of fill can cause the death of a tree. Lowering the grade can destroy major portions of a root system.

Damages: Any tree damages or injuries should be reported to the project arborist as soon as possible. Severed roots shall be pruned cleanly to healthy tissue, using proper pruning tools. Broken branches or limbs shall be pruned according to International Society of Arboriculture Pruning Guidelines and ANSI A-300, part 1 Pruning Standards.

Preventive Measures: Before construction begins, irrigation and fertilization of the affected trees is recommended to improve tree vigor and health. Soil analysis testing should be completed to assure fertilization with the appropriate fertilizer products. Pruning of the tree canopies and branches should be done at the direction of the project arborist to remove any dead or broken branches, and to provide the necessary clearances for the construction equipment.

Monitoring and Maintenance

Most edge trees not in the construction area, not designated to be removed, and not impacted by construction access, can remain, be monitored, and maintained for the long term, based on the project manager's plans, budget and judgement. All City street trees must remain, unless removal permits are provided. However, better pruning and better soil management by the owners will increase the longevity and appearance of the remaining trees. Some trees along the construction access routes may need to be trimmed up for construction vehicle clearance. This needs to be determined by the general contractor before work begins, but should be according to ANSI A300 standards.

Trees at the edges of construction first need to be trimmed up as necessary and fenced at their driplines to protect them. There are many aspects of construction that can harm the roots and or canopies of the trees. Periodic monitoring of the trees is advised during construction by an expert that would recognize the potential threats and be able to correctly identify their status. The frequency of monitoring visits should be *at least* monthly.

If portions of the irrigation system need to be shut down during construction, plans need to be made in advance to provide supplemental irrigation for landscape areas that would be deprived.

Begin training up the canopy for better clearance over the drive aisles and entries. Consider their width when they reach a more mature size. None of these trees are full grown.

The lower limbs that will be removed for clearance should not be cut back to the trunk in one pruning cycle. Cut them back slightly inside and below the upper canopy, leaving at least 80 percent of the foliage the first year. Depending on limb size, they may need to be removed over several years or more. When the lower limb is finally fully removed, cut back only to the branch collar. Do not remove more than 20% of the total foliage in any one pruning cycle.

All pruning must conform to American National Standards Institute A300, part 1. The trees listed in the matrix as "save if corrected" means corrective pruning to these standards. If only low-bid pruning will be applied, the trees marked in this way should be removed.

Due to the shallow roots of nearly all parking lot trees, to keep trees that remain stable and healthy, they will need at least twelve times trunk diameter clearance for root cutting, assuming roots are cleanly cut, not torn, e.g., a 10-inch DBH tree needs 10 feet of clearance. All cutting of roots over 1" diameter must be made with clean cuts. A backhoe will not make a clean cut.

Credentials

American Society of Consulting Arborists – Registered Consulting Arborist #365
American Society of Consulting Arborists – Tree & Plant Appraisal Qualified
American Society of Landscape Architects (ASLA), Emeritus
International Society of Arboriculture – Tree Risk Assessment Qualified
International Society of Arboriculture – Certified Arborist #WE-0180a

Experience

Mr. Applegate is an independent consulting arborist. He has been in the horticulture industry since 1963, providing professional arboricultural consulting since 1984 within both private and public sectors. His expertise includes appraisal, tree preservation, diagnosis of tree and palm growth problems, construction impact mitigation, environmental assessment, expert witness testimony, risk assessment, pruning specifications, species selection and tree health monitoring.

Mr. Applegate consults for insurance companies, major developers, universities, theme parks, universities, homeowners' associations, landscape architects, landscape contractors, property managers, attorneys and governmental bodies.

Notable projects on which he has consulted are: Disneyland, Disneyland Hotel, DisneySeas-Tokyo, Disney's Wild Animal Kingdom, the New Tomorrowland, Disney's California Adventure, Disney Hong Kong project, Universal Studios, Knott's Berry Farm, J. Paul Getty Museum, Tustin Ranch, Newport Coast, Crystal Court, Newport Fashion Island Palms, Bixby Ranch Country Club, Playa Vista, MTA Purple and Expo Lines, MWD-California Lakes, Loyola-Marymount campus, Cal Tech, Cal State Long Beach, Pierce College, The Irvine Concourse, UCI, USC, UCLA, LA City College, LA Trade Tech, Riverside City College, Crafton Hills College, and the State of California review of the Landscape Architecture License exam (re: plant materials)

Education

Bachelor of Science in Landscape Architecture,
California State Polytechnic University, Pomona 1973
Arboricultural Consulting Academy (by ASCA)
Arbor-Day Farm, Kansas City 1995
Continuing Education Courses in Arboriculture
required to maintain Certified Arborist status and for ASCA membership

Professional Affiliations

American Society of Consulting Arborists (ASCA), Full Member
American Society of Landscape Architects (ASLA), Full Member
International Society of Arboriculture (ISA), Regular Member
International Palm Society (IPS), Member
California Tree Failure Report Program, UC Davis, Participant
Street Tree Seminar (STS), Associate Member

Community Affiliations

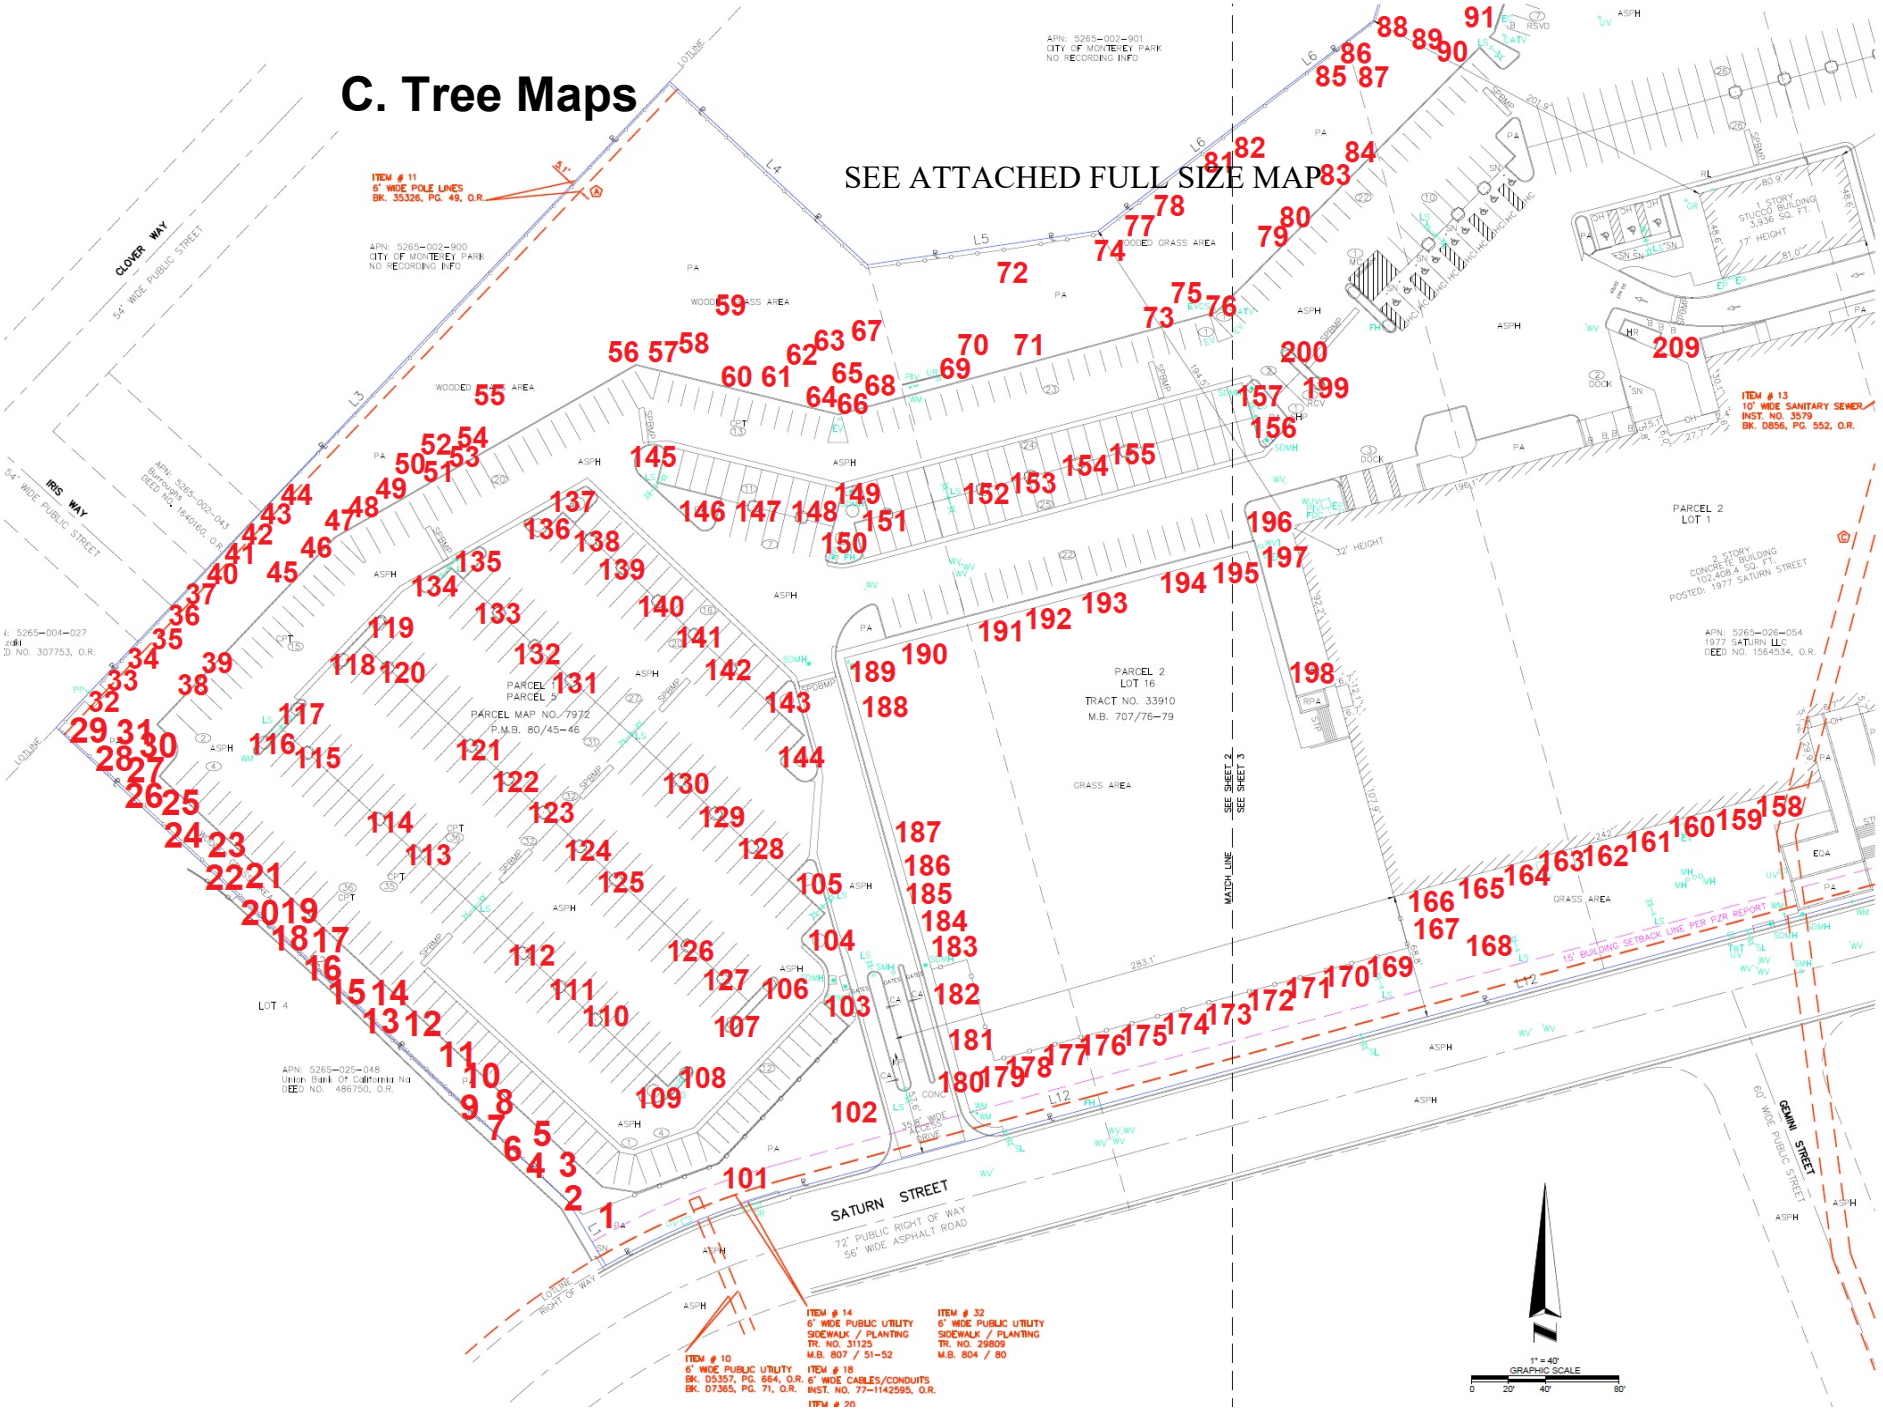
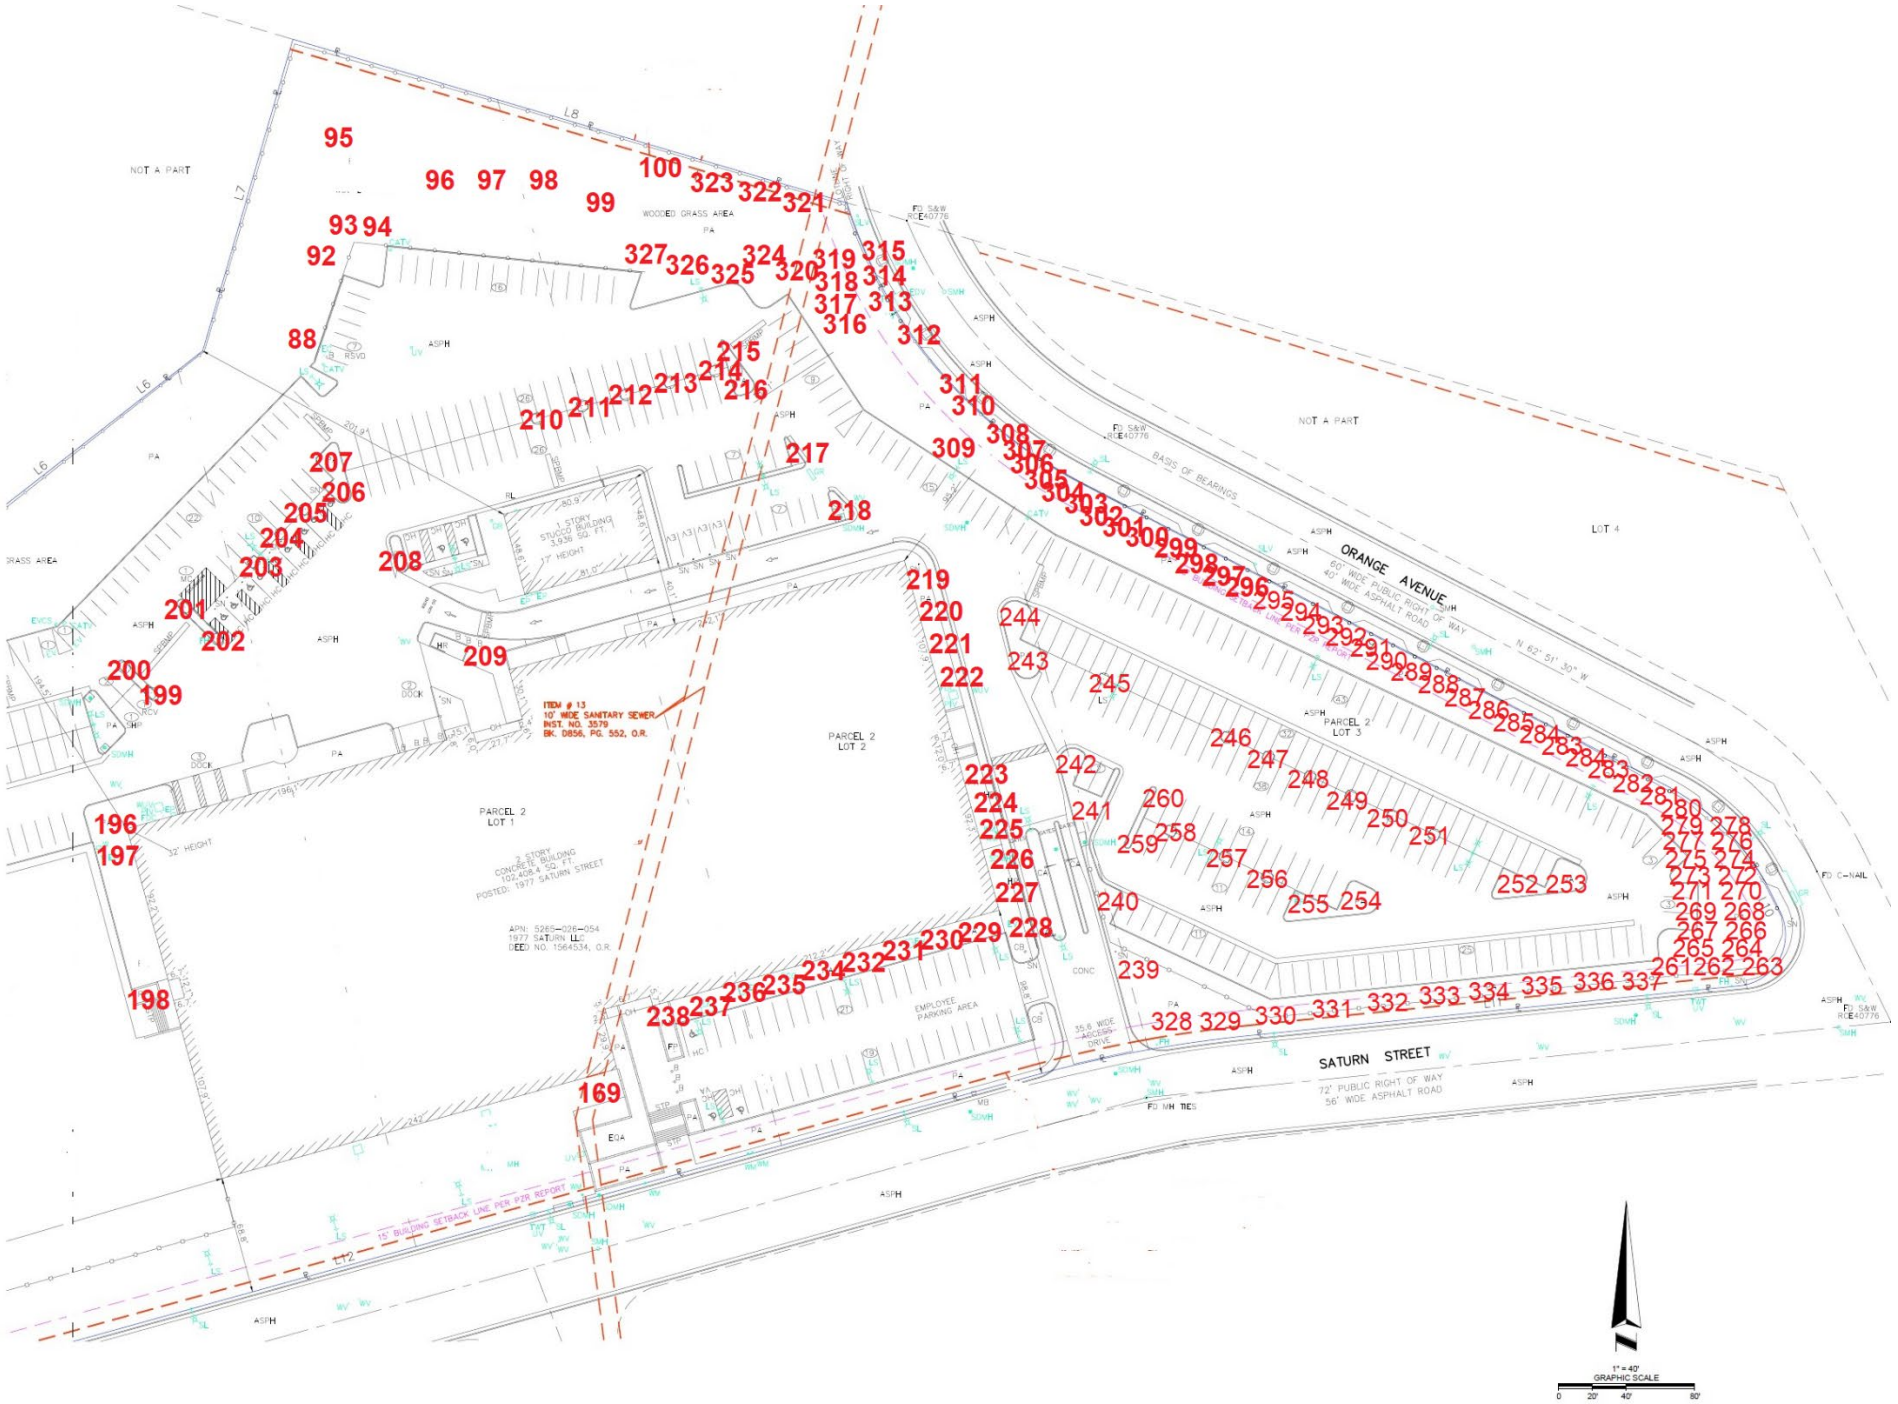
American Institute of Landscape Architects Board of Directors (1980-82)
California Landscape Architect Student Scholarship Fund-Chairman (1985)
International Society of Arboriculture-Examiner-tree worker certification (1990)
Guest lecturer at UCLA, Cal Poly, Saddleback College, & Palomar Junior College

B. Glossary



Air-roots	pneumatophores, a special type of breathing root, which is stemmed out from the subterranean root system. Most notably they help the plants of salt marshes to absorb oxygen and other gases from the air, e.g. bald cypress, but also some palm species in heavy and/or wet soils.
ANSI	American National Standards Institute, ANSI A300 pertains to trees, ANSI A300 part 1, pruning
Arboriculture	The selection, cultivation, and care of trees, vines, and shrubs.
Arborist	A person possessing the technical competence through experience and related training to provide for or supervise the management of trees or other woody plants in a landscape setting.
ASCA	The American Society of Consulting Arborists, Inc. a professional society, as described in its by-laws.
ASLA	American Society of Landscape Architects, Inc. a professional society, as described in its by-laws
Branch angle	The angle of attachment between two branches, aka crotch angle.
Canopy	The part of the crown composed of foliage and twigs, for an individual tree or collective group of trees.
Chlorotic	Lacking in chlorophyll, typically yellow or yellowish in color.
Codominant	Leaders equal in size and relative importance, developed from two apical buds at the top of a stem. Each codominant stem is an extension of the stem below it. There are no branch collars or trunk collars at the bases of codominant stems.
Crown	The upper portions of a tree or shrub, including the main limbs, branches, and twigs.
Crown reduction	Reducing the size of the canopy using thinning versus heading cuts. Should not exceed 20 to 25 percent branch removal.
Crown restoration	Restoration of natural and/or structurally sound form to a tree which has been previously topped, headed or damaged. (synonym – crown restructure pruning)
Cultivar	A unique form or type propagated through selective breeding and maintained for specific purposes and retains those attributes in further propagation. An acronym for “cultivated variety”; cultivars can be naturally occurring plants, but usually have been cultivated with specific desirable characteristics in appearance and/or resilience. Maybe a field selection or a horticultural variety that has originated and persisted under cultivation. Usually enclosed in single quotes after the genus and species names.
Decay	Progressive deterioration of organic tissues, usually caused by fungal or bacterial organisms, resulting in loss of cell structure, strength, and function. In wood, the loss of structural strength.



Decline	Progressive reduction of health or vigor of a plant.
Dripline	A projected line on the ground that corresponds to the spread of branches in the canopy; the farthest spread of branches.
Epicormic	Epi - upon; cormic – stem. Branches that are upon the stem, i.e. sprouting from either dormant buds in the cambial zone, or from buds sprung anew from ray traces. Epicormic shoots are a sign that energy reserves have been lowered
Excurrent	Referring to crowns having a strong central leader.
Flush cut	Pruning technique in which both branch and stem tissue are removed, generally considered poor practice
Gall	An abnormal swollen lump on the trunk, limb or roots, possibly caused by insects or bacteria
Girdling root	A root that partially or entirely encircles the trunk and/or buttress roots, which could restrict growth and downward movement of photosynthate and/or water and nutrients up.
Heading	Pruning techniques where the cut is made to a bud, weak lateral branch or stub.
Included bark	Bark or cortex tissue that is included or trapped between close-growing branches. Usually found in narrow or tight crotches.
Leader	A dominant upright stem, usually the main trunk. There can be several leaders in one tree.
Limb	A large lateral branch growing from the main trunk.
Lion-tailed	The removal of all, or a great deal of, the inner branches and/or watersprouts from the crown of a tree. Lion's Tailing is not an acceptable pruning practice, see ANSI A-300.10.1.7.
Over-lifted	More than 30% of the lower limbs removed.
Over-pruned	More than 25% of the foliage removed.
Root system	The portion of the tree containing the root organs, including buttress roots, transport roots, and fine absorbing roots; all underground parts of the tree.
Scaffold limb	Primary structural branch of the crown.
Sprout	Also water sprout. A shoot or stem that grows from the bark of a tree; adventitious or secondary growth.
Stress	"Stress is a potentially injurious, reversible condition, caused by energy drain, disruption, or blockage, or by life processes operating near the limits for which they were genetically programmed." Alex Shigo

Shrub	The name usually given to a relatively short (less than 15 feet) woody plant, with multiple stems arising near the ground.
Suppressed	Trees which have been overtopped and whose crown development is restricted from above
Topping	The practice of cutting large limbs back severely, without regard to form or habit of the tree. Cuts are usually made between lateral branch nodes. This practice is extremely injurious to trees, and promotes decay in the canopy.
Trees	woody plant, (more than 15 feet) with a single or few trunks near the base.
Value	The relative worth, merit, or importance of a thing, expressed as a single point, a range, or a relationship to a benchmark.
Vigor	Active, healthy growth of plants: ability to respond to stress factors.

Disclaimer

Good, current information on tree preservation has been applied. However, even when every tree is inspected, inspection involves sampling, therefore some areas of decay or weakness may be missed. A complete tree hazard evaluation was not requested or performed. Weather, winds and the magnitude and direction of storms are not predictable and some failures may still occur despite the best application of high professional standards – especially considering the unknown amount of necessary root cutting. Future tree maintenance will also affect the trees health and stability and is not under the supervision or scrutiny of this consultant. Continuing construction activity such as trenching will also affect the health and safety, but are unknown and unsupervised by this consultant. Trees are living, dynamic organisms and their future status cannot be predicted with complete certainty by any expert. This consultant does not assume liability for any tree failures involved with this property.

Should the plans change, additional trees may need to be evaluated for likely impacts and mitigation measures. This report is in response to the proposed plans provided to this consultant, and the accepted scope of work.

Certification

I, Gregory W. Applegate, certify to the best of my knowledge and belief:

That the statements of fact contained in this report are true and correct. That the report analysis, opinions, and conclusions are limited only the reported assumptions and limiting conditions, and are my personal unbiased professional analysis, opinions and conclusions.

That I have no present or prospective interest in the vegetation that is the subject of this report, and I have no personal interest or bias with respect to the parties involved.

That my compensation is not contingent upon a reporting that favors the cause of the client, the attainment of a stipulated result, or the occurrence of a subsequent event.

That my analysis, opinions, and conclusions were developed, and this report has been prepared, in conformity the standards of arboricultural practice.

That I have made a personal inspection of the plants that are the subject of this report.

Furthermore, the opinions above are held with reasonable degree of professional certainty, predicated on over 50 years of experience in the nursery, landscape, and arboricultural industries and the documents and information provided me.

BCR CONSULTING LLC

July 17, 2024

MANAGEMENT SUMMARY

BCR Consulting LLC (BCR Consulting) is under contract to SDCF Monterey Park, LLC to conduct a Cultural Resources Assessment of the 1977 Saturn Data Center Project (project) in the City of Monterey Park, Los Angeles County, California. The work is being performed pursuant to the California Environmental Quality Act (CEQA). A cultural resources records search, additional research, field survey, and Sacred Lands File Search with the Native American Heritage Commission (NAHC) were conducted for the project. The records search revealed that 12 cultural resource studies have taken place resulting in five cultural resources identified within a one-half mile radius of the project site. Of the 12 previous studies, one has assessed the project site for cultural resources, and no cultural resources have been previously identified within its boundaries.

During the research and field survey, BCR Consulting archaeologists identified a historic-period (45 or more years old) office building that occupies the project site. BCR Consulting recommends that this resource does not meet eligibility criteria for the California Register of Historical Resources (California Register) and as such it is not recommended a historical resource under CEQA. Based on these results no further cultural resource work is recommended for the current undertaking. Disturbances associated with previous excavation and construction of the existing historic-period building at the project site have been severe and have disrupted soil beyond depths at which buried cultural resources are likely. Also, no significant buried cultural resources have been recorded in the vicinity of the project site. As a result, the potential to encounter in-situ remains associated with significant archaeological materials during project-related excavation is low.

While the current study has not indicated sensitivity for unknown cultural resources within the project boundaries, ground disturbing activities always have the potential to reveal buried deposits not observed on the surface during previous surveys. Prior to the initiation of ground-disturbing activities, field personnel should be alerted to the possibility of buried prehistoric or historic cultural deposits. In the event that field personnel encounter buried cultural materials, work in the immediate vicinity of the find should cease and a qualified archaeologist should be retained to assess the significance of the find. The qualified archaeologist shall have the authority to stop or divert construction excavation as necessary. If the qualified archaeologist finds that any cultural resources present meet eligibility requirements for listing on the California Register or the National Register, plans for the treatment, evaluation, and mitigation of impacts to the find will need to be developed. Prehistoric or historic cultural materials that may be encountered during ground-disturbing activities include:

- historic artifacts such as glass bottles and fragments, cans, nails, ceramic and pottery fragments, and other metal objects;
- historic structural or building foundations, walkways, cisterns, pipes, privies, and other structural elements;
- prehistoric flaked-stone artifacts and debitage (waste material), consisting of obsidian, basalt, and or cryptocrystalline silicates;
- groundstone artifacts, including mortars, pestles, and grinding slabs;
- dark, greasy soil that may be associated with charcoal, ash, bone, shell, flaked stone, groundstone, and fire affected rocks.

Results of the Sacred Lands File search were positive and the NAHC recommended contacting the Gabrieleno Band of Mission Indians-Kizh Nation for more information. The City will initiate Assembly Bill (AB) 52 Native American Consultation for the project with tribes, as required. Since the city will initiate and carry out the required Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff is available to answer questions and address concerns as necessary.

According to CEQA Guidelines, projects subject to CEQA must determine whether the project would "directly or indirectly destroy a unique paleontological resource". The Paleontological Overview provided in Appendix E has recommended that:

> I have conducted a thorough search of our paleontology collection records for the locality and specimen data for proposed development at the Stratcap 1977 Saturn project area as outlined on the portion of the El Monte USGS topographic quadrangle map that you sent to me via e-mail on February 20, 2024. We do not have any fossil localities that lie directly within the proposed project area, but we do have fossil localities nearby from the same sedimentary deposits that may occur in the proposed project area, either at the surface or at depth.
>
> The following table shows the closest known localities in the collection of the Natural History Museum of Los Angeles County (NHMLA).
>
> [Table excluded, see Appendix E]
>
> This records search covers only the records of the NHMLA. It is not intended as a paleontological assessment of the project area for the purposes of CEQA or NEPA. Potentially fossil-bearing units are present in the project area, either at the surface or in the subsurface. As such, NHMLA recommends that a full paleontological assessment of the project area be conducted by a paleontologist meeting Federal (43 Code of Federal Regulations Part 49.110) or Society of Vertebrate Paleontology standards.

If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

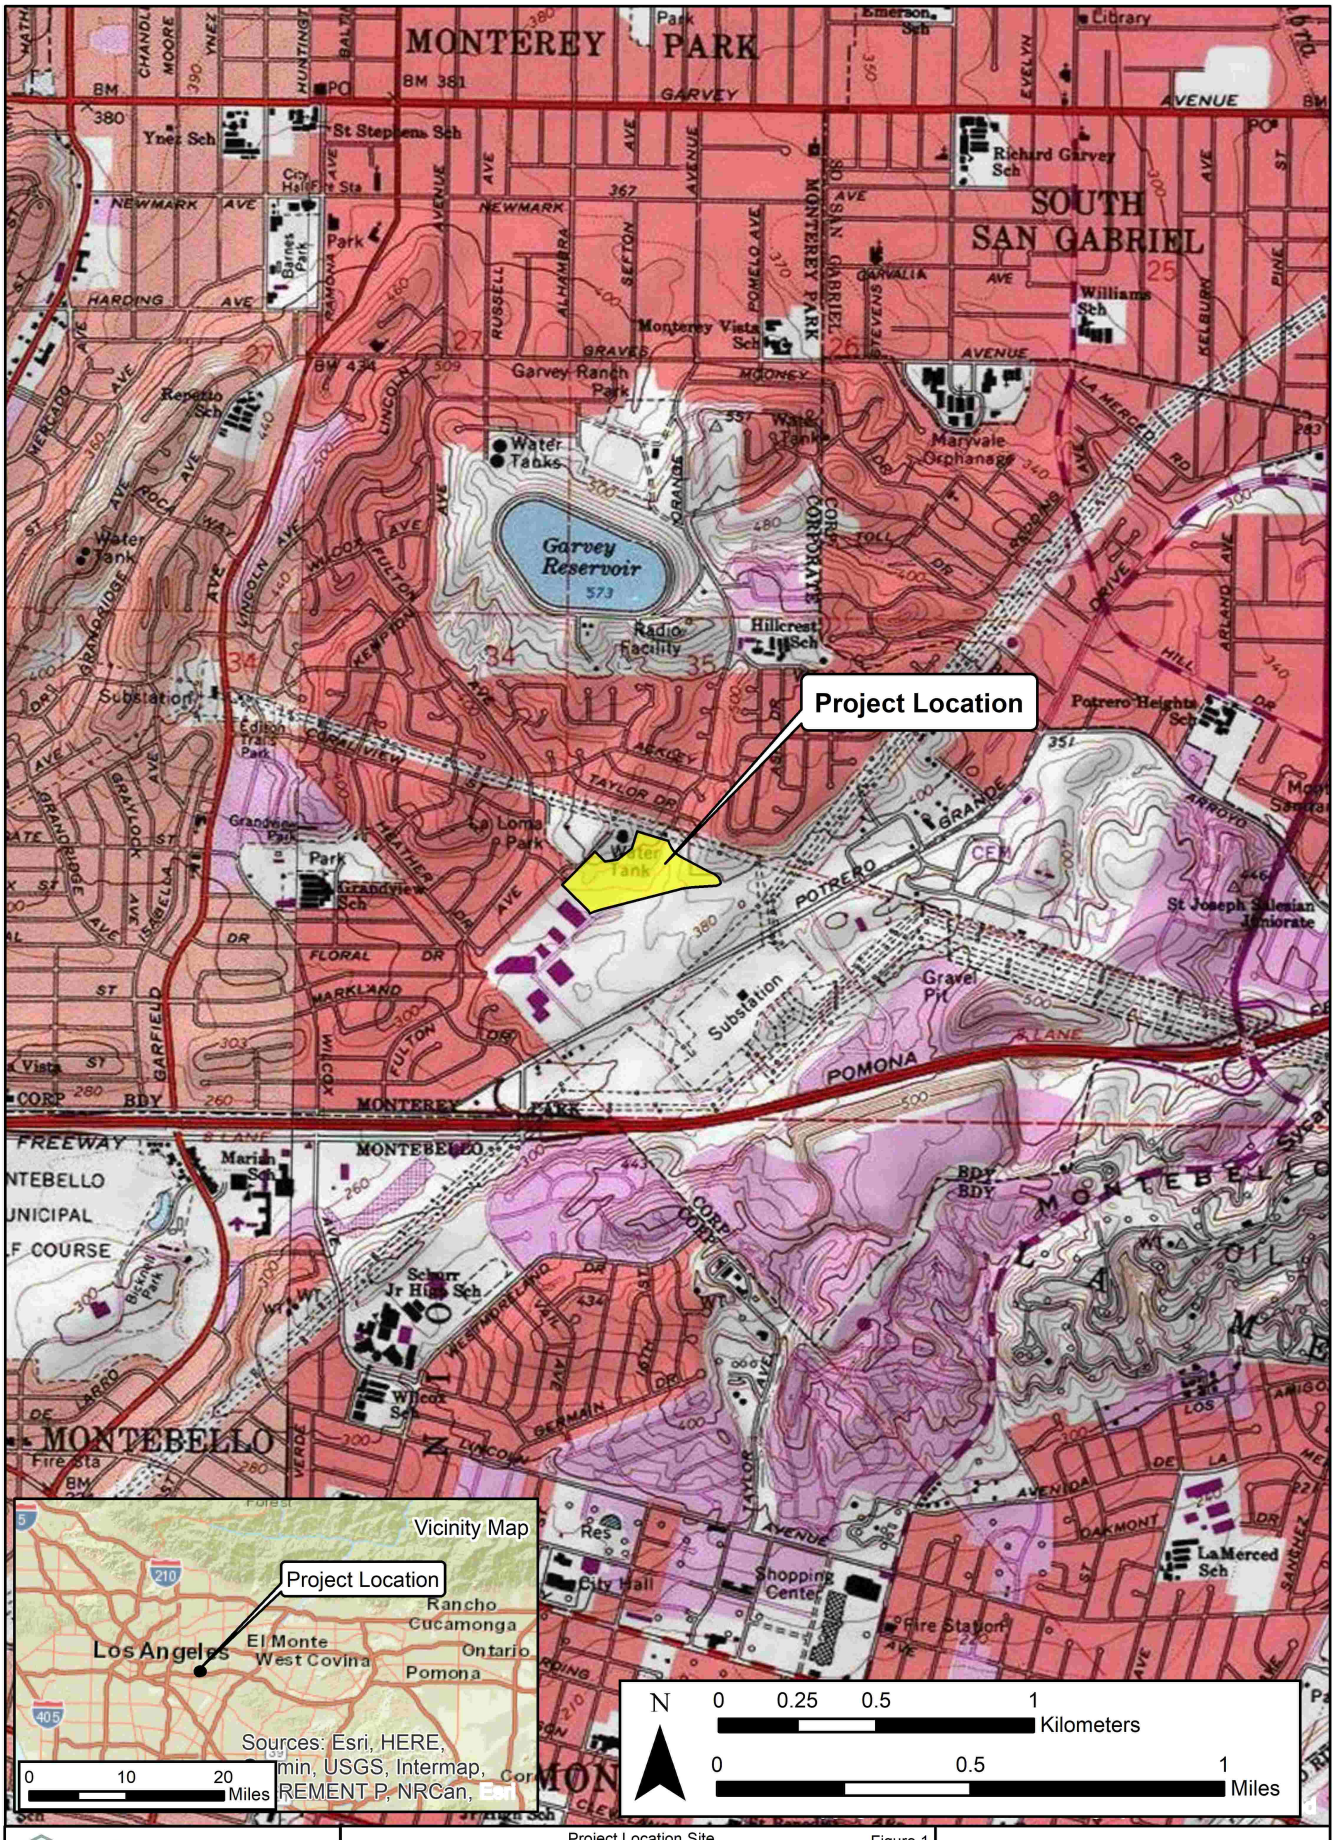
INTRODUCTION

BCR Consulting LLC (BCR Consulting) is under contract to SDCF Monterey Park, LLC to complete a Cultural Resources Assessment of the 1977 Saturn Data Center Project (project) in the City of Monterey Park (City), Los Angeles County, California. The project occupies approximately 15.80 acres and is bound by a municipal property to the north, commercial complexes to the south and southwest, residential properties to the northwest and northeast, and vacant lots to the east. A cultural resources records search, additional research, intensive-level pedestrian field survey, paleontological overview, and Sacred Lands File search with the Native American Heritage Commission (NAHC) were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA). The project site is located in a non-sectioned portion of Township 1 South, Range 12 West, San Bernardino Baseline and Meridian. It is depicted on the United States Geological Survey (USGS) *El Monte, California* (1994) 7.5-minute topographic quadrangle (Figure 1).



Regulatory Setting

The California Environmental Quality Act. CEQA applies to all discretionary projects undertaken or subject to approval by the state's public agencies (California Code of Regulations 14(3), § 15002(i)). Under CEQA, "A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (Cal. Code Regs. tit. 14(3), § 15064.5(b)). State CEQA Guidelines section 15064.5(a) defines a "historical resource" as a resource that meets one or more of the following criteria:

- Listed in, or eligible for listing in, the California Register of Historical Resources (California Register)
- Listed in a local register of historical resources (as defined at Cal. Public Res. Code § 5020.1(k))
- Identified as significant in a historical resource survey meeting the requirements of § 5024.1(g) of the Cal. Public Res. Code
- Determined to be a historical resource by a project's lead agency (Cal. Code Regs. tit. 14(3), § 15064.5(a))

A historical resource consists of "Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California…Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing in the California Register of Historical Resources" (Cal. Code Regs. tit. 14(3), § 15064.5(a)(3)).

The significance of a historical resource is impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for the California Register. If an impact on a historical or archaeological resource is significant, CEQA requires feasible measures to minimize the impact (State CEQA Guidelines § 15126.4 (a)(1)). Mitigation of significant impacts must lessen or eliminate the physical impact that the project will have on the resource.

Figure 1

SDCF Monterey Park, LLC

Section 5024.1 of the Cal. Public Res. Code established the California Register. Generally, a resource is considered by the lead agency to be "historically significant" if the resource meets the criteria for listing in the California Register (Cal. Code Regs. tit. 14(3), § 15064.5(a)(3)). The eligibility criteria for the California Register are similar to those of the National Register of Historic Places (National Register), and a resource that meets one or more of the eligibility criteria of the National Register will be eligible for the California Register. The California Register program encourages public recognition and protection of resources of architectural, historical, archaeological, and cultural significance, identifies historical resources for state and local planning purposes, determines eligibility for state historic preservation grant funding and affords certain protections under CEQA. Criteria for Designation:

1. Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
2. Associated with the lives of persons important to local, California or national history.
3. Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values.
4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). Fifty years is normally considered sufficient time for a potential historical resource, and in order that the evaluation remain valid for a minimum of five years after the date of this report, all resources older than 45 years (i.e. resources from the "historic-period") will be evaluated for California Register listing eligibility, or CEQA significance. The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

Finally, CEQA requires that significant effects on unique archaeological resources be considered and addressed. CEQA defines a unique archaeological resource as any archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

CEQA Guidelines Section 15064.5 Appendix G includes significance criteria relative to archaeological and historical resources. These have been utilized as thresholds of significance here, and a project would have a significant environmental impact if it would:

a) cause a substantial adverse change in the significance of a historical resource as defined in section 10564.5;

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 10564.5;

c) Disturb any human remains, including those interred outside of formal cemeteries.

Tribal Cultural Resources. The Legislature added requirements regarding tribal cultural resources for CEQA in Assembly Bill 52 (AB 52) that took effect July 1, 2015. AB 52 requires consultation with California Native American tribes and consideration of tribal cultural resources in the CEQA process. By including tribal cultural resources early in the CEQA process, the legislature intended to ensure that local and Tribal governments, public agencies, and project proponents would have information available, early in the project planning process, to identify and address potential adverse impacts to tribal cultural resources. By taking this proactive approach, the legislature also intended to reduce the potential for delay and conflicts in the environmental review process. To help determine whether a project may have such an effect, the Public Resources Code requires a lead agency to consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a Proposed Project. Since the City will initiate and carry out the required AB52 Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff are available to answer questions and address comments as necessary.

Paleontological Resources. CEQA provides guidance relative to significant impacts on paleontological resources, indicating that a project would have a significant impact on paleontological resources if it disturbs or destroys a unique paleontological resource or site or unique geologic feature. Section 5097.5 of the California Public Resources Code specifies that any unauthorized removal of paleontological remains is a misdemeanor. Further, California Penal Code Section 622.5 sets the penalties for damage or removal of paleontological resources. CEQA documentation prepared for projects would be required to analyze paleontological resources as a condition of the CEQA process to disclose potential impacts. Please note that as of January 2018 paleontological resources are considered in the geological rather than cultural category. Therefore, paleontological resources are not summarized in the body of this report.

NATURAL SETTING

The local geologic region coincides with the physiographic area known as the Los Angeles Basin. It is characterized as a transverse-oriented lowland basin and coastal plain approximately 50 miles long and 20 miles wide. The basin originated as a deep marine trough during the Pliocene (7-2 million years ago) that eventually filled with shallow water fossil bearing sediments. By the beginning of the Pleistocene (after 2 million years ago) uplifting created the series of plains and mesas along the coast that now characterize the

area (Lambert 1994, Mendenhall 1905, Woodford et al. 1954). Local rainfall ranges from 5 to 15 inches annually (Jaeger and Smith 1971:36-37). The project region comprises a portion of the Los Angeles River flood plain, which (locally channelized and paved) flows from north to south. Although much of the native vegetation has been locally removed, chaparral, coastal sage scrub, and riparian vegetation communities dominate regional flora. Key native plants include black sage, California brittlebush, California buckwheat, California sagebrush, deerweed, golden yarrow, laurel sumac, lemonadeberry, poison oak, purple sage, sticky monkeyflower, sugar bush, toyon, white sage, coastal century plant, coastal cholla, prickly-pear cactus, arroyo willow, and bulrush. These plants were utilized by local animal species, kangaroo rats, California horned lizard, orange-throated whiptail, horned lizard, brown-headed cowbird, California gnatcatcher, California quail, cactus wren, darkling beetle, harvester ant, and Palos Verdes blue butterfly (Williams et al. 2008:117,122). Peripheral species included deer, and various rodents, rabbits, and birds -many of which were utilized by prehistoric and historic inhabitants (see Lightfoot and Parrish 2009).

CULTURAL SETTING

Prehistoric Context

Two primary regional syntheses are commonly utilized in the archaeological literature for southern California. The first was advanced by Wallace in 1955, and defines four cultural horizons, each with characteristic local variations: Early Man Horizon, Milling Stone, Intermediate, and Late Prehistoric. Employing a more ecological approach, Warren and Crabtree (1986) defined five periods in southern California prehistory: Lake Mojave, Pinto, Gypsum, Saratoga Springs, and Protohistoric. Warren and Crabtree viewed cultural continuity and change in terms of various significant environmental shifts, defining the cultural ecological approach for archaeological research of the California deserts and coast. Many changes in settlement patterns and subsistence focus are viewed as cultural adaptations to a changing environment, beginning with the gradual environmental warming in the late Pleistocene, the desiccation of the desert lakes during the early Holocene, the short return to pluvial conditions during the middle Holocene, and the general warming and drying trend, with periodic reversals that continue to this day (Warren and Crabtree 1986).

Ethnography

Although no prehistoric sites have been locally recorded, in general the project site is situated within Gabrielino territory.

Gabrielino. The Gabrielino probably first encountered Europeans when Spanish explorers reached California's southern coast during the 15th and 16th centuries (Bean and Smith 1978; Kroeber 1925). The first documented encounter, however, occurred in 1769 when Gaspar de Portola's expedition crossed Gabrielino territory (Bean and Smith 1978). Other brief encounters took place over the years and are documented in McCawley 1996 (citing numerous sources). The Gabrielino name has been attributed by association with the Spanish mission of San Gabriel, and refers to a subset of people sharing speech and customs with other Cupan speakers (such as the Juaneño/Luiseño/Ajachemem) from the greater Takic branch of the Uto-Aztecan language family (Bean and Smith 1978). Gabrielino villages occupied the watersheds of various rivers (locally including the Santa Ana) and intermittent streams. Chiefs were usually descended through the male line and often

administered several villages. Gabrielino society was somewhat stratified and is thought to have contained three hierarchically ordered social classes which dictated ownership rights and social status and obligations (Bean and Smith 1978:540-546). Plants utilized for food were heavily relied upon and included acorn-producing oaks, as well as seed-producing grasses and sage. Animal protein was commonly derived from rabbits and deer in inland regions, while coastal populations supplemented their diets with fish, shellfish, and marine mammals (Boscana 1933, Heizer 1968, Johnston 1962, McCawley 1996). Dog, coyote, bear, tree squirrel, pigeon, dove, mud hen, eagle, buzzard, raven, lizards, frogs, and turtles were specifically not utilized as a food source (Kroeber 1925:652).

History

Historic-era California is generally divided into three periods: the Spanish or Mission Period (1769 to 1821), the Mexican or Rancho Period (1821 to 1848), and the American Period (1848 to present).

Spanish Period. The first European to pass through the area is thought to be a Spaniard called Father Francisco Garces. Having become familiar with the area, Garces acted as a guide to Juan Bautista de Anza, who had been commissioned to lead a group across the desert from a Spanish outpost in Arizona to set up quarters at the Mission San Gabriel in 1771 near what today is Pasadena (Beck and Haase 1974). Garces was followed by Alta California Governor Pedro Fages, who briefly explored the region in 1772. Searching for San Diego Presidio deserters, Fages had traveled through Riverside to San Bernardino, crossed over the mountains into the Mojave Desert, and then journeyed westward to the San Joaquin Valley (Beck and Haase 1974).

Mexican Period. In 1821, Mexico overthrew Spanish rule and the missions began to decline. By 1833, the Mexican government passed the Secularization Act, and the missions, reorganized as parish churches, lost their vast land holdings, and released their neophytes (Beattie and Beattie 1974).

American Period. The American Period, 1848–Present, began with the Treaty of Guadalupe Hidalgo. In 1850, California was accepted into the Union of the United States primarily due to the population increase created by the Gold Rush of 1849. The cattle industry reached its greatest prosperity during the first years of the American Period. Mexican Period land grants had created large pastoral estates in California, and demand for beef during the Gold Rush led to a cattle boom that lasted from 1849–1855. However, beginning about 1855, the demand for beef began to decline due to imports of sheep from New Mexico and cattle from the Mississippi and Missouri Valleys. When the beef market collapsed, many California ranchers lost their ranchos through foreclosure. A series of disastrous floods in 1861–1862, followed by a significant drought further diminished the economic impact of local ranching. This decline combined with ubiquitous agricultural and real estate developments of the late 19th century, set the stage for diversified economic pursuits that continue to this day (Beattie and Beattie 1974; Cleland 1941).

Monterey Park. Prior to the discovery of gold at Sutter's Mill in 1848, settlements throughout the state consisted of scattered missions and ranches with most streams and rivers running uncontrolled. Spanish Rancher Jose Lugo built the first Adobe in 1840 near

what is now South Garfield Avenue in Monterey Park. During the Gold Rush, miners built hundreds of miles of flumes to sluice gold in streams, creeks, and rivers. Gold became scarce by the 1860s, and many residents of the newly admitted state of California turned to farming which heightened the demand for water. In subsequent decades the expansion of local agriculture was accompanied by higher populations and a diversified economy.

Following the American Civil War, some of the West San Gabriel Valley's first European settlers were arriving in the area, among them was a young Italian Shepherd named Alessandro Repetto who would build one of the first residences in what is now Monterey Park. Repetto purchased 5,000 acres from Rancho San Antonio and built his residence about one-half mile north of where Garfield Avenue intersects with the Pomona Freeway. Some years later, following his service as a mail courier for both the Pony Express and the US Army, Richard Garvey purchased property in the King's Hills of Monterey Pass. He established a ranch and began bringing in spring water from nearby Rio Hondo and formed Garvey Lake near the current location of Garvey Ranch Park. The 1881 completion of the Southern Pacific Railroad and the 1885 completion of the Santa Fe Railroad connected the region from the Mexican border as far north as Ventura and as far inland as Arizona. This resulted in an influx of settlers and land speculators who began subdividing and developing local tracts (Brock et. al. 1992:19). Groundwater was pumped through artesian wells, and open canals were commonly used to transport water as early as the 1860s. Over his lifetime, Richard Garvey sold parcels of his land to pay debts and costs incurred for development of his property beginning in 1906, with what was known as Ramona Acres, northeast of what is now the intersection of Garvey and Garfield Avenues.

The swell of southern California's population into the twentieth century necessitated more creative means of meeting both domestic and commercial water demands (Carle 2004:227; California Department of Water Resources 2020; Harding 1960:2, 109). After learning of a plan for their northern neighbors in Pasadena, South Pasadena, and Alhambra to build a sewage facility adjacent to their community, the residents of what is now Monterey Park voted in favor of cityhood in 1916. The City's new board of directors outlawed sewage facilities within city boundaries and derived its name from an old government map labeling the hills of the area as "Monterey Hills". By 1920, a large area of southern Monterey Park had separated from Monterey Park and formed the city of Montebello. By this time, Asian and Asian-American populations began settling in the Monterey Highlands area, establishing potato and flower farms, as well as improving and renaming the Monterey Pass Trail, now named Coyote Pass by Pioneer Masami Abe. In 1926, bagged potato chips were invented by Laura Scudder near the corner of Atlantic and Garvey Avenue. Scudder ran her business in the back of her husband's gas station, and would iron wax paper bags closed to maintain the freshness of the chips inside before distributing them to retailers.

Real estate had boomed as an industry by the 1920's due to the development of residential subdivisions and growing commercial opportunities. One individual at the center of this phenomenon was Peter N. Snyder, who was responsible for much of the development along Atlantic Boulevard and Garfield Avenue. Snyder aspired to establish a garden community in the Monterey Hills to rival Bel-Air and Beverly Hills to the northwest. This development was to be named Midwick View Estates, and would be centered around Jardin del Encanto, a Spanish-style building with impressive water features that still remains today and would

have served as the administrative and community center. The development flopped due to the Great Depression. Development in the area, like much of the country, had stagnated following the depression and saw little growth until the end of World War II. After World War II residential subdivisions were constructed throughout the San Gabriel Valley to accommodate returning service personnel. Development continued to proliferate through the 1960s and 1970s, and former industrial landmarks such as the old Davidson Brickyard was replaced by strip malls, modern corporate centers, and industrial parks (Monterey Park 2023; Sonksen 2013).

Lloyd's Bank. Lloyd's Bank California was the initial occupant of the project site, and briefly in 1980 utilized the project location as their US headquarters (Los Angeles Times 1980). Currently known as Lloyd's Banking Group, Lloyds Bank was established in Birmingham, England in 1765 by Sampson Lloyd and John Taylor. The bank was originally known as Taylors & Lloyds and occupied the same office in Birmingham until 1864, providing finance services in Birmingham during the industrial revolution. In 1853 it was renamed Lloyds and Company and having merged with Moilliet and Sons in 1865 became incorporated as Lloyds Banking Company Ltd. Under its new name it became a joint-stock investment bank and began to invest capital in various industrial sectors to maximize yields with minimal risk exposure. It became Lloyds Bank Ltd. in 1889. As the bank continued to expand its capital base, it reorganized from a partnership to a corporation with shareholders and a board of directors. From the late 19th to the early 20th century, Lloyds acquired the assets of more than 50 banks and after World War I it merged with Capital & Counties Bank making it one of the largest banks in England. In 1971 Lloyds acquired most of BOLSA International Bank, Ltd and the merger resulted in the formation of Lloyds and BOLSA International Bank, Ltd., which expanded its holdings into France, Spain, and Portugal. By 1978 it had branches and/or subsidiaries throughout 43 countries and its members could utilize its financial services globally. Lloyds merged with the Trustee Savings Bank in 1995 and it became known as Lloyds TSB Group PLC, and in 2009 it absorbed Halifax Bank of Scotland PLC, creating Lloyds Banking Group, as it is currently known. During the financial crisis of 2008, the United Kingdom government took large equity stakes in several of that country's largest banks to help avoid a financial collapse and in doing so became the owner of 43 percent of Lloyds. The government increased its equity stake to 65 percent in 2009. As conditions improved, the government reduced its ownership to 24 percent by 2015.

Functionally, Lloyd's accounting was calculated by individual bankers until 1929 when they began to use a mechanized system. By 1962 early computers were in use to process increasingly complex financial calculations and in 1972, Lloyd's installed a Cashpoint machine in Brentwood, Essex which was the United Kingdom's first real time Automatic Teller Machine. Internet banking was launched in 1998 and the first mobile app appeared in 2011. Today, Lloyds Banking Group is one of the larges banks in the United Kingdom and is currently headquartered in London (Lloyds Banking Group 2024, Duignan 2024).

The subject building was operated by Lloyds Bank California which formed in 1974 as a subsidiary of Lloyds and BOLSA International Bank, Ltd. Lloyds Bank of California initiated some automated services and by 1981 all systems utilized the IBM computer. Its ATM network expanded significantly in 1984 when Lloyds Bank California joined 11 other financial institutions to utilize the Star System ATM network. In 1985, Lloyds bank began to

explore unloading capital of Lloyds Bank California due to poor returns and reallocating its U.S. resources, divesting from individuals to refocus on its corporate business in New York (Broder 1986). In 1986 Sanwa Bank California acquired Lloyds Bank California's branches (including the project site). Sanwa Bank operated at the project site until about 2001 when Sanwa Bank California merged with Tokai Bank of California (Reckard 2002).

PERSONNEL

David Brunzell, M.A., RPA acted as the Project Manager and Principal Investigator for the current study. Mr. Brunzell meets the United States Secretary of the Interior Professional Qualification Standards for Archaeology and Architectural History. Mr. Brunzell completed the Department of Park and Recreation (DPR) 523 forms and wrote the technical report with contributions from BCR Consulting Archaeological Field Director Nicholas Shepetuk, B.A. BCR Consulting Staff Archaeologist Douglas Kazmier, B.A., conducted the field survey.

METHODS

This work was completed pursuant to CEQA, the Public Resources Code (PRC) Chapter 2.6, Section 21083.2, and California Code of Regulations (CCR) Title 14, Chapter 3, Article 5, Section 15064.5. The pedestrian cultural resources survey was intended to locate and document previously recorded or new cultural resources, including archaeological sites, features, isolates, and historic-period buildings, that exceed 45 years in age within defined project boundaries. The project site was examined using 15-meter transect intervals, where accessible. This study is intended to determine whether cultural resources are located within the project boundaries, whether any cultural resources are significant pursuant to the above-referenced regulations and standards, and to develop specific mitigation measures that will address potential impacts to existing or potential resources. Tasks pursued to achieve that end include:

- Cultural resources records search to review the results of any studies conducted within a half-mile radius of the project boundaries;
- Additional research through various local and regional resources;
- Systematic pedestrian survey of the entire accessible project site;
- California Register eligibility evaluation for resources identified;
- Development of recommendations and mitigation measures for cultural resources documented within the project boundaries, following CEQA;
- Completion of DPR 523 forms for any discovered cultural resources.

Research

Records Search. On February 14, 2024 (prior to the field survey) a records search was conducted at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton. This archival research reviewed the status of all recorded historic and prehistoric cultural resources, and survey and excavation reports completed within one-half mile of the project site. Additional resources reviewed included the National Register, the California Register, and documents and inventories published by the California Office of Historic Preservation. These include the lists of California Historical Landmarks, California

Points of Historical Interest, Listing of National Register Properties, and the Inventory of Historic Structures.

Additional Research. BCR Consulting performed additional research through Los Angeles County Assessor's records, historic aerial photographs, and various other internet resources.

Field Survey

An intensive-level cultural resources field survey of the project site was conducted on February 21, 2024. The survey was conducted by walking parallel transects spaced approximately 15 meters apart across the accessible project site. Cultural Resources were recorded on DPR 523 forms. Digital photographs were taken at various points within the project site. These included overviews as well as detail photographs of all cultural resources. Cultural resources were recorded per the California OHP *Instructions for Recording Historical Resources* in the field using:

- Detailed note taking for entry on DPR Forms (see Appendix A)
- Hand-held Garmin Global Positioning systems for mapping purposes
- Digital photographic overviews and photographs of all cultural resources (see Appendix A and C).

RESULTS

Research

Records Search. Data from the SCCIC revealed that 12 previous cultural resources studies have taken place, and five cultural resources have been recorded within one-half mile of the project site. One of the previous studies has assessed the project site for cultural resources resulting in no cultural resources having been recorded within its boundaries. The records search results are summarized in Table A, and the complete records search bibliography is provided in Appendix B.

Table A. Cultural Resources and Reports Within One-Half Mile of the Project Site

USGS 7.5 Min Quad	Cultural Resources Within One-Half Mile of Project Site	Studies W/in One-Half Mile
El Monte, California (1994)	P-19-190175: Historic-Period Transmission Tower (0.4 Miles NW) P-19-190261: Historic-Period Transmission Tower (0.1 Miles N) P-19-190502: Historic-Period Transmission Line (0.35 Miles SE) P-19-190508: Historic-Period Transmission Line (0.45 Miles SE) P-19-192441: Historic-Period Substation (0.3 Miles SE)	LA-547, 1013*, 5476, 6303, 8700, 9705, 10175, 11990, 11991, 12040, 12137, 13261

*Previously assessed a portion of the project site

Additional Research. Additional research was performed for the project site to provide the background for the historic-period building within its boundaries. According to Los Angeles County Assessor records, the commercial building that occupies the project site was constructed in 1979 and City records show that its first building permit was issued on June 19, 1979 (Los Angeles County Assessor 2023; Monterey Park 2024). Historic aerial photographs indicate that landscaping and completion of the attached parking lot was not

complete until 1982. No alterations to the property, other than maintenance and upkeep, are discernable based on this research. As indicated in the History section above, the subject building was operated by Lloyds Bank California from 1980 until divesting to Sanwa Bank in 1986. Sanwa Bank operated at the project site until about 2001 when Sanwa Bank California merged with Tokai Bank of California (Reckard 2002).

The building is described in the Field Survey section below. Research has not revealed an architect or designer. The building was exhibits features consistent with an architectural style known as Corporate Modernism, an outgrowth of International Style. Henry Russell Hitchcock and Phillip Johnson proposed the International Style in 1932, using it to reference buildings constructed as early as 1922 and through the 1930s primarily in France and Germany. Its popularity spread through the 1930s and 1940s to the United Kingdom, North and South American, Scandinavia, and Japan. In the 1950s and 1960s the style was nearly ubiquitous in the design of skyscrapers in the United States. In the 1970s and 1980s the International Style had gone out of fashion as formulaic and it gave way to updated forms of design and decoration as well as building materials that became known as postmodern. Major architects that utilized the International Style included Richard Neutra and Philip Johnson in the United States, Walter Gropius and Ludwig Mies van der Rohe in Germany and the U.S., J.J.P. Oud in the Netherlands, and Le Corbusier in France. Characteristics include rectilinear forms with minimal decoration and ornament, open interior spaces, and use of cantilever construction intended to convey the illusion of weightlessness. Materials emphasize highly visible glass and steel and rely heavily on reinforced concrete that is usually less visible (Zelazko 2024).

The term Corporate Modernism was coined by Historian David Nye to describe the blending of modernist aesthetics with corporate interests. Its roots can be traced to businesses in the 1930s who designed unique and futuristic products “emphasizing sleekness, streamlined contours, and functional appearance” that utilized more modern materials that would conform to economic limitations of the era (Sacasas 2012). It has been used to describe many International Style buildings constructed in the late 20th century (Hanly 2024). Gordon Bunshaft is cited as the creator of the style although some of its hallmarks predate his creations and research has not revealed that he ever used the term. Bunshaft’s designs were widely used in post-World War II office towers, banks, and apartment buildings in New York City. The Lever House in New York represents Bunshaft’s most well recognized and comprehensive contribution to the style, reflecting the ubiquitous features of “gridded geometries, glass spandrels, and volumes that were boxes of slabs surrounded by open space, which would then be applied, often with much lesser degrees of success, to countless buildings across America and the world” (Berman 2023).

The eastern municipal water tank adjacent to the north side of the subject property was constructed between 1953 and 1956, and the western tank was added between 2000 and 2003 (USDA 1928, 1938, 1948, 1952, 1953, 1956, 1964, 1972, 1980, 1981, 1982, 2000, 2003). The general character of the rest of the surrounding area has not changed significantly since prior to the development of the subject property. The majority of the residential neighborhoods in the area were constructed between 1948 and 1980. Garvey Reservoir, a major local landmark located 0.45 miles north of the project site, was constructed between 1953 and 1956.

Field Survey

During the field survey, Mr. Kazmier carefully inspected the project site and identified one historic-period commercial building at 1977 Saturn Street, described in detail below. One main building and one utility building were present on the property. No artifacts or potential for significant buried remains have been identified. DPR 523 Forms required to record the building are included in Appendix A, and photographs are provided in Appendix A and C.

No other cultural resources (including prehistoric or historic archaeological or historic architectural resources) were identified during the field survey. Much of the project site has been paved over or was otherwise subject to severe disturbances related to construction or intensive landscaping. Sediments, where visible, consist of loamy sand, most of which has been imported. Vegetation is limited to landscaped grasses and ornamental trees.

1977 Saturn Street. This historic-period commercial building was originally constructed in 1979 (Los Angeles County Assessor 2023; Monterey Park 2024) for use as a corporate office. Lloyd's Bank California was the initial occupant and briefly in 1980 utilized the location as their US headquarters (Los Angeles Times 1980). They occupied the building from 1980 to 1986, after which Sanwa Bank occupied the building until about 2002. The building is a four-story steel-frame concrete structure. Fenestration comprises two horizontally oriented, parallel, solid rows of reflective windows, or glass spandrels, that stretch around the majority of the building perimeter. Four large bay doors are located on the northern elevation. Smaller entryways are located along the length of the building's perimeter at irregular intervals. The primary access doors are located near the center of the southern edge and are set approximately 10 feet into the exterior walls. The west half of the building is approximately half-a-story lower and 30 feet farther to the southeast. This design was meant to compensate for the westerly slope on which it was constructed. There are multiple rooftop equipment enclosures that run along the center axis of the building. Its stylistic elements that are consistent with Corporate Modernism include rectilinear form with minimal decoration and ornament, glass spandrels, and reinforced concrete. It lacks the characteristic gridded geometry, cantilever construction, highly visible steel, and boxes of slabs surrounded by open spaces present in the more representative examples of the style.

SIGNIFICANCE EVALUATIONS

During the field survey, one historic-period cultural resource was identified. CEQA calls for the evaluation and recordation of historic and archaeological resources. The criteria for determining the significance of impacts to cultural resources are based on Section 15064.5 of the *CEQA Guidelines* and Guidelines for the Nomination of Properties to the California Register. Properties eligible for listing in the California Register and subject to review under CEQA are those meeting the criteria for listing in the California Register, or designation under a local ordinance.

Significance Criteria

California Register of Historical Resources. The California Register criteria are based on National Register criteria. For a property to be eligible for inclusion on the California Register or as a City Landmark, one or more of the following criteria must be met:

1. It is associated with the events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the U.S.;
2. It is associated with the lives of persons important to local, California, or U.S. history;
3. It embodies the distinctive characteristics of a type, period, region, or method of construction, represents the work of a master, possesses high artistic values; and/or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

Evaluations

1977 Saturn Street. The building located at the project site fits within the context of Late 20th Century commercial development, specifically in Monterey Park through the 1960s and 1970s when strip malls, modern corporate centers, and industrial parks began to replace former industrial landmarks. The building was briefly utilized by Lloyds Banking Group during a foray into California. Research has not indicated that this represented a significant expansion or contraction of the business or of California's financial market. Research has failed to associate it with important events related to the development of the area. It is therefore not eligible for the California Register under California Register Criterion 1. Research has also failed to associate the building with the lives of any persons important to local, California, or U.S. History. This resource is therefore not eligible for the California Register under California Register Criterion 2. The resource contains some stylistic elements of Corporate Modernism but is not a particularly distinctive example of the style. Research has failed to indicate that it represents the work of an important creative individual or possess high artistic values. Therefore, the building is not eligible under California Register Criterion 3. The resource has not and is not likely to yield information important to prehistory or history and is therefore not eligible for listing under California Register Criterion 4. Based on these results, the project site and its historic-period buildings are recommended not eligible under any of the four criteria for listing on the California Register, and as such are not recommended historical resources under CEQA.

RECOMMENDATIONS

During the research and field survey, BCR Consulting archaeologists identified a historic-period office building that occupies the project site. BCR Consulting recommends that this resource does not meet eligibility criteria for the California Register and as such it is not recommended a historical resource under CEQA. Based on these results no further cultural resource work is recommended for the current undertaking. Disturbances associated with previous excavation and construction of the existing historic-period building at the project site have been severe and have disrupted soil beyond depths at which buried cultural resources are likely. Also, no significant buried cultural resources have been recorded in the vicinity of the project site. As a result, the potential to encounter in-situ remains associated

with significant archaeological materials during project-related excavation is low. Therefore, no significant impact related to historical resources is anticipated and no further investigations are recommended unless:

- The proposed project is changed to include areas that have not been subject to this cultural resource assessment;
- Cultural materials are encountered during project activities.

The current study attempted to determine whether significant archaeological deposits were present on the proposed project site. Although none were yielded during the records search and field survey, ground-disturbing activities have the potential to reveal buried deposits not observed on the surface. Prior to the initiation of ground-disturbing activities, field personnel should be alerted to the possibility of buried prehistoric or historic cultural deposits. In the event that field personnel encounter buried cultural materials, work in the immediate vicinity of the find should cease and a qualified archaeologist should be retained to assess the significance of the find. The qualified archaeologist shall have the authority to stop or divert construction excavation as necessary. If the qualified archaeologist finds that any cultural resources present meet eligibility requirements for listing on the California Register or the National Register, plans for the treatment, evaluation, and mitigation of impacts to the find will need to be developed. Prehistoric or historic cultural materials that may be encountered during ground-disturbing activities include:

- historic-period artifacts such as glass bottles and fragments, cans, nails, ceramic and pottery fragments, and other metal objects;
- historic-period structural or building foundations, walkways, cisterns, pipes, privies, and other structural elements;
- prehistoric flaked-stone artifacts and debitage (waste material), consisting of obsidian, basalt, and or cryptocrystalline silicates;
- groundstone artifacts, including mortars, pestles, and grinding slabs;
- dark, greasy soil that may be associated with charcoal, ash, bone, shell, flaked stone, groundstone, and fire affected rocks;
- human remains.

Results of the Sacred Lands File search were positive and the NAHC recommended contacting the Gabrieleno Band of Mission Indians-Kizh Nation for more information. The City will initiate Assembly Bill (AB) 52 Native American Consultation for the project with tribes, as required. Since the city will initiate and carry out the required Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff is available to answer questions and address concerns as necessary.

According to CEQA Guidelines, projects subject to CEQA must determine whether the project would “directly or indirectly destroy a unique paleontological resource”. The Paleontological Overview provided in Appendix E has recommended that:

> I have conducted a thorough search of our paleontology collection records for the locality and specimen data for proposed development at the Stratcap 1977 Saturn project area as outlined on the portion of the El Monte USGS topographic quadrangle map that you sent to me via e-mail on February 20, 2024. We do not

> have any fossil localities that lie directly within the proposed project area, but we do have fossil localities nearby from the same sedimentary deposits that may occur in the proposed project area, either at the surface or at depth.
>
> The following table shows the closest known localities in the collection of the Natural History Museum of Los Angeles County (NHMLA).
>
> [Table excluded, see Appendix E]
>
> This records search covers only the records of the NHMLA. It is not intended as a paleontological assessment of the project area for the purposes of CEQA or NEPA. Potentially fossil-bearing units are present in the project area, either at the surface or in the subsurface. As such, NHMLA recommends that a full paleontological assessment of the project area be conducted by a paleontologist meeting Federal (43 Code of Federal Regulations Part 49.110) or Society of Vertebrate Paleontology standards.

If human remains are encountered during any project activities, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the NAHC, which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

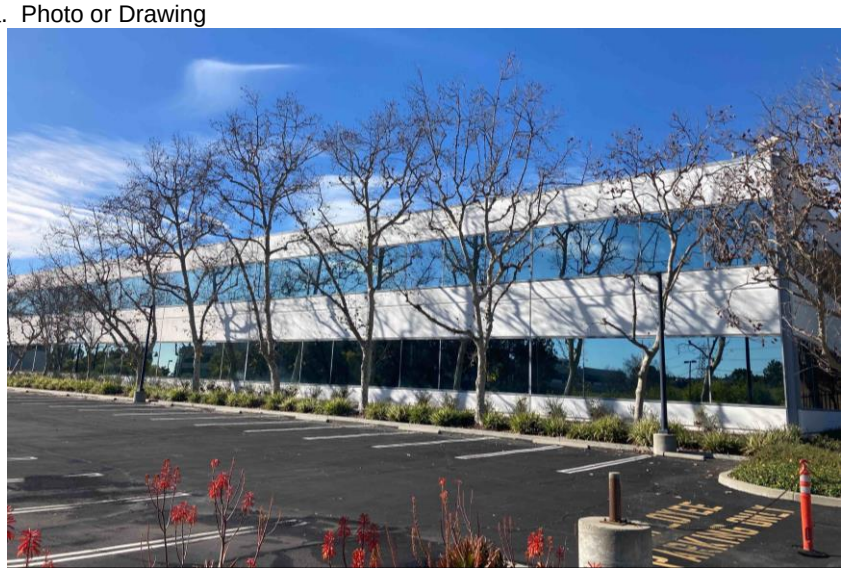
APPENDIX A

DEPARTMENT OF PARKS AND RECREATION 523 FORMS



P1. Other Identifier: 1977 Saturn Street
***P2. Location:** ☐ **Not for Publication** ☑ **Unrestricted** ***a. County:** Los Angeles
and (P2b and P2c or P2d. Attach a Location Map as necessary.)
***b. USGS 7.5' Quad:** *El Monte, California* **Date:** 1981 **T** 1 S; **R** 12 W; Section 36**;** SBBM
c. Address: N/A City: Monterey Park Zip: 91755
d. UTM: Zone: 11S 397143 mE/ 3767139 mN (SW corner; G.P.S.; NAD83) Elevation: 1440 feet AMSL
e. Other Locational Data: This resource is located approximately 477 feet west by northwest of the intersection of Saturn Street and S Orange Ave.

***P3a. Description:** (Describe resource and its major elements: design, materials, condition, alterations, size, setting, boundaries)
This commercial building was originally constructed in 1979 (Los Angeles County Assessor) for use as a corporate office. Research has not revealed the exact date that the construction was completed, but the earliest building permit (record no. BH-005537) available through the City of Monterey Park was dated June 19, 1979 (City of Monterey Park 2024). A copy of the permit was not available through the City, so the nature of the permit is unknown. Since construction was completed at an unknown date before June 19, it is likely that the building is over 45 years old and is being treated as a "potential historical resource." Lloyd's Bank California was the initial occupant and briefly utilized the location as their US headquarters (Los Angeles Times 1980). The building is four stories. Fenestration comprises two horizontally-oriented, parallel, solid rows of reflective windows that stretch around the majority of the building perimeter. Four large bay doors are located on the northern elevation. Smaller entryways are located along the length of the building's perimeter at irregular intervals. The primary access doors are located near the center of the southern edge and are set approximately 10 feet into the exterior walls. The west half of the building is approximately half-a-story lower and 30 feet farther to the southeast. This design was meant to compensate for the westerly slope on which it was constructed. There are multiple rooftop equipment enclosures that run along the center axis of the building.

Its stylistic elements that are consistent with Corporate Modernism include rectilinear form with minimal decoration and ornament, glass spandrels, and reinforced concrete. It lacks the characteristic gridded geometry, cantilever construction, highly visible steel, and boxes of slabs surrounded by open spaces present in the more representative examples of the styles.

***P3b. Resource Attributes:** HP7. 3+ story commercial building

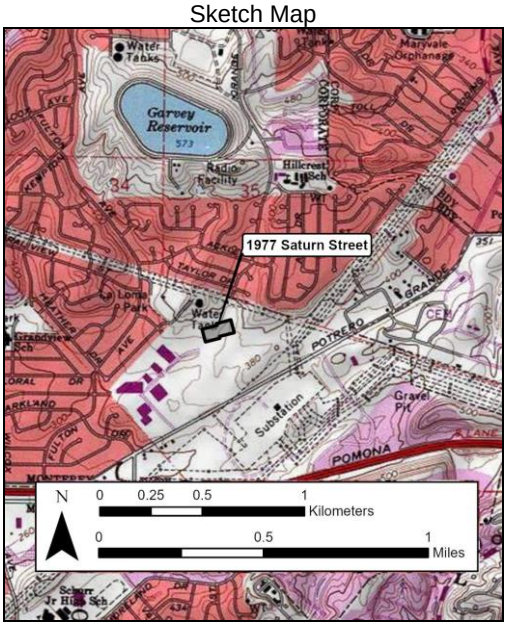
B1. Historic Name: N/A B2. Common Name: 1977 Saturn Street
B3. Original Use: Corporate Office

***B5. Architectural Style:** Corporate Modernism

***B6. Construction History:** (Construction date, alterations, and date of alterations):
According to Los Angeles County Assessor records, the commercial building that occupies the project site was constructed in 1979 and City records show that its first building permit was issued on June 19, 1979. Historic aerial photographs indicate that landscaping and completion of the attached parking lot was not complete until 1982. No alterations to the property, other than maintenance and upkeep, are discernable based on this research. The subject building was operated by Lloyds Bank California from 1980 until divesting to Sanwa Bank in 1986. Sanwa Bank operated at the project site until about 2001 when Sanwa Bank California merged with Tokai Bank of California.

***B7. Moved?** ☑No ☐Yes ☐Unknown



***B8. Related Features:** None

B9a. Architect: Unknown b. Builder: Unknown

***B10. Significance: Theme:** Late 20th Century Commercial Development **Area:** Monterey Park **Property Type:** Industrial
Applicable Criteria: N/A
(Discuss importance in terms of historical/architectural context as defined by theme/period/geographic scope. Address integrity.)
(See Continuation Sheet, Page 3 for Historical Context)

National Register of Historic Places and the California Register of Historical Resources requires that a significance criterion (A-D; 1-4) be met for a resource to be eligible. A resource is eligible if (A/1) it is associated with events that have made a significant contribution to the broad patterns of history and cultural heritage; (B/2) it is associated with the lives of persons important in the past; (C/3) it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value; or (D/4) it has yielded or is likely to yield information important in prehistory or history. The National Register and the California Register also require that sufficient time has passed since a resource's period of significance (normally 45 years) to "obtain a scholarly perspective on the events or individuals associated with the resources". The National Register and the California Register also require that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

Sketch Map

The building located at the project site fits within the context of Late 20th Century commercial development, specifically in Monterey Park through the 1960s and 1970s when strip malls, modern corporate centers, and industrial parks began to replace former industrial landmarks. The building was briefly utilized by Lloyds Banking Group during a foray into California. Research has not indicated that this represented a significant expansion or contraction of the business or of California's financial market. Research has failed to associate it with important events related to the development of the area. It is therefore not eligible under Criterion A/1. That research has also failed to associate the building with the lives of any persons important to local, California, or U.S. History. This resource is therefore not eligible under Criterion A/2. The resource contains some stylistic elements of Corporate Modernism but is not a particularly distinctive example of the style. Research has failed to indicate that it represents the work of an important creative individual or possess high artistic values. Therefore, the building is not eligible under Criterion C/3. The resource has not and is not likely to yield information important to prehistory or history and is therefore not eligible for listing under California Register Criterion D/4. Based on these results, the project site and its historic-period buildings are recommended not eligible under any of the four criteria for listing and BCR Consulting recommends assigning at Status Code of 6Z.

B11. Additional Resource Attributes: None

***B12. References:** See Page 5
***B14. Evaluators:** David Brunzell, BCR Consulting, Claremont, California
***Date of Evaluation** 06/08/2023

B10. Significance (Continued from page 2.)

Monterey Park. Prior to the discovery of gold at Sutter's Mill in 1848, settlements throughout the state consisted of scattered missions and ranches with most streams and rivers running uncontrolled. Spanish Rancher Jose Lugo built the first Adobe in 1840 near what is now South Garfield Avenue in Monterey Park. During the Gold Rush, miners built hundreds of miles of flumes to sluice gold in streams, creeks, and rivers. Gold became scarce by the 1860s, and many residents of the newly admitted state of California turned to farming which heightened the demand for water. In subsequent decades the expansion of local agriculture was accompanied by higher populations and a diversified economy.

Following the American Civil War, some of the West San Gabriel Valley's first European settlers were arriving in the area, among them was a young Italian Shepherd named Alessandro Repetto who would build one of the first residences in what is now Monterey Park. Repetto purchased 5,000 acres from Rancho San Antonio and built his residence about one-half mile north of where Garfield Avenue intersects with the Pomona Freeway. Some years later, following his service as a mail courier for both the Pony Express and the US Army, Richard Garvey purchased property in the King's Hills of Monterey Pass. He established a ranch and began bringing in spring water from nearby Rio Hondo and formed Garvey Lake near the current location of Garvey Ranch Park. The 1881 completion of the Southern Pacific Railroad and the 1885 completion of the Santa Fe Railroad connected the region from the Mexican border as far north as Ventura and as far inland as Arizona. This resulted in an influx of settlers and land speculators who began subdividing and developing local tracts (Brock et. al. 1992:19). Groundwater was pumped through artesian wells, and open canals were commonly used to transport water as early as the 1860s. Over his lifetime, Richard Garvey sold parcels of his land to pay debts and costs incurred for development of his property beginning in 1906, with what was known as Ramona Acres, northeast of what is now the intersection of Garvey and Garfield Avenues.

The swell of southern California's population into the twentieth century necessitated more creative means of meeting both domestic and commercial water demands (Carle 2004:227; California Department of Water Resources 2020; Harding 1960:2, 109). After learning of a plan for their northern neighbors in Pasadena, South Pasadena, and Alhambra to build a sewage facility adjacent to their community, the residents of what is now Monterey Park voted in favor of cityhood in 1916. The City's new board of directors outlawed sewage facilities within city boundaries and derived its name from an old government map labeling the hills of the area as "Monterey Hills". By 1920, a large area of southern Monterey Park had separated from Monterey Park and formed the city of Montebello. By this time, Asian and Asian-American populations began settling in the Monterey Highlands area, establishing potato and flower farms, as well as improving and renaming the Monterey Pass Trail, now named Coyote Pass by Pioneer Masami Abe. In 1926, bagged potato chips were invented by Laura Scudder near the corner of Atlantic and Garvey Avenue. Scudder ran her business in the back of her husband's gas station, and would iron wax paper bags closed to maintain the freshness of the chips inside before distributing them to retailers.

Real estate had boomed as an industry by the 1920's due to the development of residential subdivisions and growing commercial opportunities. One individual at the center of this phenomenon was Peter N. Snyder, who was responsible for much of the development along Atlantic Boulevard and Garfield Avenue. Snyder aspired to establish a garden community in the Monterey Hills to rival Bel-Air and Beverly Hills to the northwest. This development was to be named Midwick View Estates, and would be centered around Jardin del Encanto, a Spanish-style building with impressive water features that still remains today and would have served as the administrative and community center. The development flopped due to the Great Depression. Development in the area, like much of the country, had stagnated following the depression and saw little growth until the end of World War II. After World War II residential subdivisions were constructed throughout the San Gabriel Valley to accommodate returning service personnel. Development continued to proliferate through the 1960s and 1970s, and former industrial landmarks such as the old Davidson Brickyard was replaced by strip malls, modern corporate centers, and industrial parks (Monterey Park 2023; Sonksen 2013).

Lloyd's Bank. Lloyd's Bank California was the initial occupant of the project site, and briefly in 1980 utilized the project location as their US headquarters (Los Angeles Times 1980). Currently known as Lloyd's Banking Group, Lloyds Bank was established in Birmingham, England in 1765 by Sampson Lloyd and John Taylor. The bank was originally known as Taylors & Lloyds and occupied the same office in Birmingham until 1864, providing finance services in Birmingham during the industrial revolution. In 1853 it was renamed Lloyds and Company and having merged with Moilliet and Sons in 1865 became incorporated as Lloyds Banking Company Ltd. Under its new name it became a joint-stock investment bank and began to invest capital in various industrial sectors to maximize yields with minimal risk exposure. It became Lloyds Bank Ltd. in 1889. As the bank continued to expand its capital base, it reorganized from a partnership to a more modern corporation with shareholders and a board of directors. From the late 19th to the early 20th century, Lloyds acquired the assets of more than 50 banks and after World War I it merged with Capital & Counties Bank making it one of the largest banks in England. In 1971 Lloyds acquired most of BOLSA International Bank, Ltd and the merger resulted in the formation of Lloyds and BOLSA International Bank, Ltd., which expanded its holdings into France, Spain, and Portugal. By 1978 it had branches and/or subsidiaries throughout 43 countries and its members could utilize its financial services globally. Lloyds merged with the Trustee Savings Bank in 1995 and it became known as Lloyds TSB Group PLC, and in 2009 it absorbed Halifax Bank of Scotland PLC, creating Lloyds Banking Group, as it is currently known. During the financial crisis of 2008, the United Kingdom government took large equity stakes in several of that country's largest banks to help avoid a financial collapse and in doing so became the owner of 43 percent of Lloyds. The government increased its equity stake to 65 percent in 2009 (Continued on page 4).

(Continued from page 3) As conditions improved, the government had reduced its ownership to 24 percent by 2015. Functionally, Lloyd's accounting was calculated by individual bankers until 1929 when they began to use a mechanized system. By 1962 early computers were in use to process increasingly complex financial calculations and in 1972, Lloyd's installed a Cashpoint machine in Brentwood, Essex which was the United Kingdom's first real time Automatic Teller Machine. Internet banking was launched in 1998 and the first mobile app appeared in 2011. Today, Lloyds Banking Group is one of the larges banks in the United Kingdom and is currently headquartered in London (Lloyds Banking Group 2024, Duignan 2024).

1977 Saturn Street. The subject building was operated by Lloyds Bank California which formed in 1974 as a subsidiary of Lloyds and BOLSA International Bank, Ltd. Lloyds Bank of California initiated some automated services and by 1981 all systems utilized the IBM computer. Its ATM network expanded significantly in 1984 when Lloyds Bank California joined 11 other financial institutions to utilize the Star System ATM network. In 1985, Lloyds bank began to explore unloading capital of Lloyds Bank California due to poor returns and reallocating its U.S. resources, divesting from individuals to refocus on its corporate business in New York (Broder 1986). In 1986 Sanwa Bank California acquired Lloyds Bank California's branches (including the project site). Sanwa Bank operated at the project site until about 2001 when Sanwa Bank California merged with Tokai Bank of California (Reckard 2002). Since the Sanwa Bank era is recent, a context is not considered relevant so has not been developed for the current project.

Additional research was performed for the project site to provide the background for the historic-period building within its boundaries. According to Los Angeles County Assessor records, the commercial building that occupies the project site was constructed in 1979 and City records show that its first building permit was issued on June 19, 1979 (Los Angeles County Assessor 2023; Monterey Park 2024). Historic aerial photographs indicate that landscaping and completion of the attached parking lot was not complete until 1982. No alterations to the property, other than maintenance and upkeep, are discernable based on this research. As indicated in the History section above, the subject building was operated by Lloyds Bank California from 1980 until divesting to Sanwa Bank in 1986. Sanwa Bank operated at the project site until about 2001 when Sanwa Bank California merged with Tokai Bank of California (Reckard 2002).

The building is described in the Field Survey section below. Research has not revealed an architect or designer. The building was exhibits features consistent with an architectural style known as Corporate Modernism, an outgrowth of International Style. Henry Russell Hitchcock and Phillip Johnson proposed the International Style in 1932, using it to reference buildings constructed as early as 1922 and through the 1930s primarily in France and Germany. Its popularity spread through the 1930s and 1940s to the United Kingdom, North and South American, Scandinavia, and Japan. In the 1950s and 1960s the style was nearly ubiquitous in the design of skyscrapers in the United States. In the 1970s and 1980s the International Style had gone out of fashion as formulaic and it gave way to updated forms of design and decoration as well as building materials that became known as postmodern. Major architects that utilized the International Style included Richard Neutra and Philip Johnson in the United States, Walter Gropius and Ludwig Mies van der Rohe in Germany and the U.S., J.J.P. Oud in the Netherlands, and Le Corbusier in France. Characteristics include rectilinear forms with minimal decoration and ornament, open interior spaces, and use of cantilever construction intended to convey the illusion of weightlessness. Materials emphasize highly visible glass and steel and rely heavily on reinforced concrete that is usually less visible (Zelazko 2024).

The term Corporate Modernism was coined by Historian David Nye to describe the blending of modernist aesthetics with corporate interests. Its roots can be traced to businesses in the 1930s who designed unique and futuristic products "emphasizing sleekness, streamlined contours, and functional appearance" that utilized more modern materials that would conform to economic limitations of the era (Sacasas 2012). It has been used to describe many International Style buildings constructed in the late 20th century (Hanly 2024). Gordon Bunshaft is cited as the creator of the style although many of its hallmarks predate his creations and research has not revealed that he ever used the term. Bunshaft's designs were widely used in post-World War II office towers, banks, and apartment buildings in New York City. The Lever House in New York represents Bunshaft's most well recognized and comprehensive contribution to the style, reflecting the ubiquitous features of "gridded geometries, glass spandrels, and volumes that were boxes of slabs surrounded by open space, which would then be applied, often with much lesser degrees of success, to countless buildings across America and the world" (Berman 2023).

The eastern municipal water tank adjacent to the north side of the subject property was constructed between 1953 and 1956, and the western tank was added between 2000 and 2003 (USDA 1928, 1938, 1948, 1952, 1953, 1956, 1964, 1972, 1980, 1981, 1982, 2000, 2003). The general character of the rest of the surrounding area has not changed significantly since prior to the development of the subject property. The majority of the residential neighborhoods in the area were constructed between 1948 and 1980. Garvey Reservoir, a major local landmark located 0.45 miles north of the project site, was constructed between 1953 and 1956.

Re: Stratcap 1977 Saturn Park Project, Los Angeles County

To Whom It May Concern:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information submitted for the above referenced project. The results were positive. Please contact the Gabrieleno Band of Mission Indians – Kizh Nation on the attached list for information. Please note that tribes do not always record their sacred sites in the SLF, nor are they required to do so. A SLF search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with a project's geographic area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites, such as the appropriate regional California Historical Research Information System (CHRIS) archaeological Information Center for the presence of recorded archaeological sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. Please contact all of those listed; if they cannot supply information, they may recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Attn: Joseph Orozco

re: Paleontological resources for the Stratcap 1977 Saturn Project (SDC2401)

Dear Joseph:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for proposed development at the Stratcap 1977 Saturn project area as outlined on the portion of the El Monte USGS topographic quadrangle map that you sent to me via e-mail on February 20, 2024. We do not have any fossil localities that lie directly within the proposed project area, but we do have fossil localities nearby from the same sedimentary deposits that may occur in the proposed project area, either at the surface or at depth.

The following table shows the closest known localities in the collection of the Natural History Museum of Los Angeles County (NHMLA).

Locality Number	Location	Formation	Taxa	Depth
LACM IP 2896, 11852, 21375, 7681	Merced Hills to the north of Whittier Narrows Recreation Area	Pico Formation (conglomerate bed in siltstone)	Invertebrates, including tusk shell (*Dentalum neohexagonium*)	Unknown
LACM VP 3363	W of Monterey Pass Road in Coyote Pass; E of the Long Beach Freeway & S of the N boundary of Section 32; Monterey Park	Unknown formation (Pleistocene; sand and silt)	Horse (*Equus*)	Unknown
LACM VP 7702	Intersection of 26th St and Atlantic Blvd, Bell Gardens	Unknown formation (Pleistocene; silt)	Fish (*Gasterosteus*); Snake (Colubridae), Rodents (*Thomomys, Microtus, Reithrodontomys)*; Rabbit (*Sylvilagus*)	30 feet bgs
LACM VP 6350-6362; LACM IP 16968-16991	Puente Hills Landfill	Fernando Formation; Repetto Member (massive clayey siltstone)	Herring *(Ganolytes)*, hake (*Merluccius*), rattail (*Coelorhynchus*), lanternfish (*Lampanyctus, Diaphus*), white shark (*Charcharodon*	Unknown

Locality Number	Location	Formation	Taxa	Depth
			carcharias); marine mammals (Cetacea); Invertebrates (unspecified)	

VP, Vertebrate Paleontology; IP, Invertebrate Paleontology; bgs, below ground surface

This records search covers only the records of the NHMLA. It is not intended as a paleontological assessment of the project area for the purposes of CEQA or NEPA. Potentially fossil-bearing units are present in the project area, either at the surface or in the subsurface. As such, NHMLA recommends that a full paleontological assessment of the project area be conducted by a paleontologist meeting Federal (43 Code of Federal Regulations Part 49.110) or Society of Vertebrate Paleontology standards.

Sincerely,

Alyssa Bell, Ph.D.
Natural History Museum of Los Angeles County

October 28, 2024

To whom it may concern,

The Applicant is proposing to construct a new data center located at 1977 Saturn Street, Monterey Park California. The project would develop an approximately 218,400 square foot building that includes data hall space and other support spaces for operations. We have conservatively estimated the peak energy load for the project. The table below provides approximately energy loads associated with the project at this stage of design.

Data Hall Area (SF)	Server Load (KW)	Mechanical Load (KW)	House Power and Lighting Loads (KW)	**Total Load (KW)**
~110,769	33,000	16,833	166	**49,999**

These energy load estimates are valid based on the level of development we are at, and can be utilized for initial analysis and modeling of the project.

Very Respectfully,

Cutis C. Spraggins, PE

California Mechanical PE#41851

Attention: Mr. Bryan Marsh, Chief Executive Officer

Subject: Geotechnical Investigation
Proposed Data Center Facility
1977 Saturn Street
Monterey Park, Los Angeles County, California

Per our October 11, 2023 proposal, Leighton Consulting, Inc. (Leighton) is pleased to present this geotechnical investigation report for the subject project. This report is intended to meet the requirements of Section 1803A.2 of the 2022 California Building Code (CBC). The purpose of our geotechnical investigation has been to evaluate the geologic and geotechnical conditions, including potential geologic hazards, within the area of and as they relate to the proposed improvements, and to provide geotechnical recommendations for design and construction of the proposed data center facility, equipment/generator yard and electrical substation.

This site is **not** located within a currently designated Alquist-Priolo Special Studies Zone for surface fault rupture. This site is also **not** within a currently designated liquefaction hazard zone. However, as is the case for most of Southern California, strong ground shaking has a strong potential to occur at this site.

This report presents our findings and conclusions regarding this project. Based upon our geotechnical investigation, the proposed improvements are feasible from a geotechnical viewpoint, provided our recommendations are incorporated into the design and construction of the project. The most significant geotechnical issues are shallow potentially compressible soils underlying the site and the potential for strong seismic shaking. These and other geotechnical issues are discussed in this report. Specific recommendations for site grading, foundations and other geotechnical aspects of the project are presented in this report.

We appreciate this opportunity to be of service. If you have any questions regarding this report or if we can be of further service, please call us at your convenience at **(866) *LEIGHTON***, directly at the phone extensions or e-mail addresses listed below.

Respectfully submitted,

LEIGHTON CONSULTING, INC.

1.0 INTRODUCTION

1.1 Site Description

The proposed data center facility, see Figure 1, *Site Location Map (*Latitude N34.0402°, Longitude W-118.1140°) is to encompass the majority of the footprint of the existing industrial building formerly operating as Saturn Electronics, as well as a portion of the adjacent landscaped area to the west of the existing structure. The site is bordered by Saturn Street to the south and southwest, South Orange Avenue to the east, , industrial buildings to the west and southeast-southwest, La Loma Reservoir and La Loma Park to the northwest, and residential developments to the northeast and west-northwest.

Based on review of available in-house geotechnical reports, the site was rough graded in 1978 under the geotechnical observation and testing of Leighton and Associates, Inc. (1978). The project site is formerly denoted as Parcels 1 through 5 of Parcel Map 10094 and Lots 1 and 2 of Tract 33910 (Leighton, 1977). See Figure 2A, *Remedial Grading Map* for lot designation and underlying geologic conditions observed and interpreted during grading and exploration of the site (Leighton, 1977, 1978).

Aerial Image Review: Review of aerial imagery and early topographic maps spanning the timeframe from 1939 to 2020 (NETR, 2023) indicate the site is primarily cut with former site elevations (El.) ranging from approximately El. 350 feet to El. 400 feet. 1939 topographic profiles (5-foot contour interval) indicated a north trending blue line canyon axis bisects the current building footprint. Elevations of this canyon onsite and below the current structure range from approximately El. 340 to El. 360 feet. The former canyon axis is roughly aligned in the approximate center of the existing building. This canyon was filled during prior grading activities at the site (Donald Warren 1971 and Leighton, 1978). Visible in the 1964 aerial image is one water tank on the hill to the northwest and grading activity south of the current site location was underway. 1972 aerial imagery shows a portion of the site and adjacent areas are being graded. By 1980 the canyon had been filled and the current structure constructed.

1.2 Proposed Development

Based on review of the 50-scale conceptual grading plan plotted December 20, 2023 and prepared by Gensler, the proposed development will consist of an approximately 218,000± square foot 1-story rectangular building located on the

southern portion of the site along Saturn Street, with an adjacent equipment yard directly north of the building. A western and eastern entryway connecting the development to Saturn Street are proposed, with a fire lane and wrapping around the building and equipment yard. Parking stalls are planned to be located to the north and east of the building and equipment yard. An electrical substation is also planned north of the equipment yard. See Figure 2A, *Boring Location Map* for overlay of the proposed development on current site imagery.

We understand the facility is designed to provide uninterrupted power and cooling services to support the continuous operation and maintenance of servers used for computational processing. The building is organized as Data Hall Galleries flanked by housing cooling units and fans. Each Data Hall is supported by two Electrical Rooms which house electrical gear, panels and batteries. The facility will feature two loading docks, one at each end of the building, for trailer trucks with an area for staging and secure storage of new equipment. Additional spaces will be used for a secure vestibule and lobby, security, two to three fiber entry vaults and fiber cross connect rooms each with diverse optical fiber feed, building restrooms, storage and open office area for facilities and maintenance staff. Electrical gear such as switches and transformers will be in the open yard along with Diesel powered generators.

The conceptual grading plan shows a building Finished Floor Elevation (FFE) of 359.00 feet above mean sea level (msl). Based on existing site grades, the proposed building footprint will require approximately 8 feet of fill on the west end and 11 feet of cut on the east end to reach proposed building grades. Retaining associated with the proposed building pad are currently planned towards the southwest corner of the building with a maximum height of 6 feet and ascending slope towards the building, and towards the southeast corner of the building with a maximum height of 4 feet and descending slope towards the building.

Preliminary structural loads for the proposed building include maximum axial dead loads of 100 kips and live loads of 50 kips for interior columns, and maximum axial dead loads of 50 kips and live loads of 25 kips for the perimeter columns. Exterior perimeter wall loads are estimated as 4 kips per linear foot. Brace frame footings include additional axial loads of 200 kips due to seismic loading.

Retaining walls with maximum heights of 21 feet are currently planned near the northern and northeastern extents of the site. These walls would be primarily a

cut condition from existing grades. Retaining walls are not currently designed, however we anticipate that they would be composed of a soil-nail system.

1.3 Previous Site Background

Leighton and Associates Inc., 1977: Leighton performed geotechnical review of grading plans prepared for Parcels 1 through 5 of Parcel Map 10094 and Lots 1 to 13 of Tract 33910 in support of summarizing the geologic and soil engineering properties of then proposed 18-Lot industrial park development. Based on that review, standard cut and fill grading techniques were planned to construct 13 level lots for industrial building construction. Grading entailed construction of 1.5:1 (horizontal:vertical) with cut slopes to 65 feet in height and 1.5:1 fill slopes a maximum of 32 feet in height. Test pit explorations were conducted onsite in support of the exploration. Site materials were characterized as a mixture of clayey silty sands, sandy clays to silts with sand and gravels noting cobbles and boulders were rare. Alluvium in the main drainage obtained a maximum thickness of four feet. Applicable data from this report is included in Appendix B, *Explorations.* Locations of these test pits are shown on Figure 2A.

Proposed cut slopes were anticipated to be stable as designed or buttressed. The keyway planned for the slope on former Lot 5 (Figure 2A) was recommended being at least 15 feet wide and two feet deep inclined to the heel of the drained key.

Leighton and Associates Inc., 1978: Leighton provided geotechnical and geologic observation and testing during grading of the site which commenced on July 10, 1978, and was completed on October 5, 1978. Standard removals of an average depth of three feet removals from the drainage north of Lot 2 (Figure 2A). Fill was placed and compacted to a standard of not less than 90 percent relative compaction. Field density tests were recorded and presented on maps used as the base for Figure 2A in this report. Earth materials observed and interpreted as sedimentary bedrock consisting of sandstone (ss), siltstone (slt) and conglomerate (cg) were reported. Distribution of earth units is shown on Figure 2B. No landslides or major faulting were observed during grading operations. Buttress keyway and subdrains were constructed during grading and the approximate location of these are shown on Figure 2B, *Remedial Grading Map.* The subdrain installed in the north trending canyon north of Lot 2 (Figure 2A) was reported as an 8-inch subdrain tied into the storm drain system offsite. Results of the field density testing and maps showing plotted locations of these tests are included in Appendix A, *Report of Rough Grading.*

Leighton Consulting Inc., 2015: Leighton provided a geotechnical exploration report for the proposed cooling tower addition project at 1980 Saturn Street in Monterey Park, California, immediately southwest of the project site. Field exploration was performed on October 23, 2015, and consisted of drilling, sampling and logging of one hollow-stem auger boring excavated to a depth of 35 feet below existing ground surface (bgs) adjacent to the proposed cooling tower pad. Subsurface soils encountered in the boring drilled for this investigation indicate the site is underlain by approximately 15 feet of compacted artificial fill overlying sedimentary bedrock of the Fernando Formation. The compacted artificial fill soils encountered generally consist of olive brown to reddish brown, slightly moist to moist, clayey sand and sandy clay with variable amounts of fine gravels. Bedrock materials encountered to the depth explored generally consist of reddish brown, slightly moist to moist, gravelly sandstone and conglomerate sandstone with variable amounts of clay within the matrix. Based upon the conditions encountered and results of geotechnical laboratory testing recommendations were provided to support the construction of the cooling tower pad as then proposed. The boring excavated in support of this project is located offsite to the southwest. The approximate location is shown on Figure 2A and the boring log is included in Appendix B.

1.4 Purpose and Scope of Exploration

The purpose of our geotechnical exploration was to evaluate the soil and groundwater conditions at the site through review of available data and subsurface explorations in order to provide geotechnical recommendations to aid in design and construction for the project as currently proposed (see Section 1.2). The scope of this geotechnical exploration included the following tasks:

- *Background Review* – A background review was performed of readily available, relevant geotechnical, civil and geological literature pertinent to the project site. References reviewed in preparation of this report are listed in Section 7.0.

- *Field Exploration* – Field exploration was performed on December 5, 2023, and consisted of drilling, sampling, and logging of five (5) hollow-stem auger borings (designated LB-1 through LB-5). Borings were excavated to depths ranging from approximately 10 feet to 36.5 feet below existing ground surface (bgs) within the footprint of the proposed building as well as the preferred substation location.

Prior to the field exploration, the borings were marked, and Underground Service Alert (USA) was notified for utility clearance. During excavating, bulk and relatively undisturbed samples were obtained from each boring for geotechnical laboratory testing. The borings were logged in the field by a geologist from our staff. Each soil sample collected was reviewed and described in accordance with the Unified Soil Classification System (USCS). The samples were sealed and packaged for transportation to our laboratory. After completion of drilling, the boring was backfilled with soil cuttings generated during the exploration, and surfaces were patched with cold-mix asphalt. The approximate locations of the borings conducted by Leighton are shown on Figure 2A, *Boring Location Map* and Figure 2B, *Remedial Grading Map*. Boring logs are included in Appendix B.

- *Laboratory Testing* – Geotechnical laboratory tests were conducted on selected bulk and undisturbed soil samples obtained from our borings. This laboratory testing program was designed to evaluate geotechnical (physical) characteristics of site soil. A description of geotechnical laboratory test- results are presented in Appendix C, *Laboratory Test Results*. The following laboratory tests were performed:

  - In-situ Moisture Content and Dry Density (ASTM D2216 and ASTM D2937);
  - Expansion Index (ASTM D4829);
  - Modified Proctor Compaction Test (ASTM D1557);
  - Atterberg Limits (ASTM D4318);
  - R Value (DOT CA Test 301);
  - Particle Size Analysis (ASTM D6913);
  - Percentage Passing Sieve No. 200 Sieve (ASTM D1140);
  - Swell or Settlement Potential (ASTM D4546); and
  - Corrosivity (Soluble Sulfate DOT CA Test 417 Part II, Soluble Chloride DOT CA Test 422, pH DOT CA Test 643, and Resistivity DOT CA Test 643).

  The in-situ moisture and density of soil samples at depths are shown on the boring logs included in Appendix B. The results of the remaining laboratory tests are presented in Appendix C.

- *Engineering Analysis* – Data obtained from field explorations and geotechnical laboratory testing was evaluated and analyzed to develop geotechnical

conclusions and provide recommendations for the project. Geologic cross section interpretations prepared for this site are presented on Plate 2, *Geotechnical Cross Section AA-BB' and CC''*.

- *Report Preparation* - Results of our geologic hazards review and geotechnical exploration have been summarized in this report, presenting our findings, conclusions and geotechnical design recommendations for design and construction of the project as currently proposed.

It should be noted that the recommendations in this report are subject to the limitations presented in Section 6.0 of the report.

2.0 GEOTECHNICAL FINDINGS

2.1 Local Geologic Units and Subsurface Conditions

Presented below are brief descriptions of the geologic units encountered in the exploratory borings completed at the site by Leighton. Detailed descriptions of the geologic units encountered are presented on the boring logs in Appendix B. Geotechnical conditions described on the logs represent the conditions at the actual exploratory excavation locations. Other variations may occur beyond and/or between the excavations. Lines of demarcation between the geologic units and the various earth materials on the logs represent approximated boundaries, and (unless otherwise noted) actual transitions may be gradual. The locations of the subsurface explorations are shown on Plate 1, Figure 2A and 2B. The subsurface profile based on data obtained and interpreted from the borings and available as-built maps (Appendix A) is shown on Plate *2.* The site and surrounding geologic units are presented on Figure 3, *Regional Geology Map*

Artificial Fill Engineered (Map Symbol Afe-1978): As indicated above in Section 1.2, the site was previously rough graded under the geotechnical observation and testing of Leighton and Associates, Inc. (1978). The fill material is locally derived from canyon alluvium and weathered bedrock of the Fernando Formation. These materials are characterized as Silty Sand (SM) with traces of gravel, to Sandy Clayey Silt (CL-ML) to Sandy Clay (CL) with fine to coarse sand to poorly graded Sand with Clay and gravels (SP-CL). Maximum density (Leighton, 1978) and optimum moisture for the fill placed during 1978 indicate optimum moisture content ranging from 8 to 10% and maximum dry density ranging from 125 to 129 pounds per cubic foot (pcf).

Artificial Fill Engineered (Map Symbol Afe-1991): Prior to 1978, we understand portions of the site were used as borrow areas during grading of adjacent areas. It was reported that fill placed on the site during grading of the industrial site to the south occurred in two phases (1961 and 1972) and was controlled by Donald R. Warren and Company for which there is no testing documentation. Based on review of available geotechnical reports for the site (Leighton and Associates, Inc., 1977 and 1978), the site is underlain by to (2) generations of compacted artificial fill with the greatest thickness primarily within a narrow canyon overlying non marine sandstone and conglomerate bedrock of the Fernando Formation. This early generation of fill material interpreted as encountered in current boring LB-2 (Appendix B) is characterized as Clay with Sand (CL-SP) and Silty Clay (ML-CL). Based on recovered data it appears the early generation of fill is primarily confined

to the narrow canyon and might be associated with construction of a reported 8-inch diameter vitrified clay pipe (VCP) sewer line, see Figure 2A.

Quaternary Alluvium (Map Symbol Qa): Alluvium, as encountered is interpreted to be limited to the narrow north trending canyon drainage underlying the eastern corner of the existing 2-story building and adjacent parking stalls. This material is overlain by engineered fill and is characterized as dark gray to reddish brown, slightly moist to moist, clay, laminated sandy clay, and poorly-graded sand. The stratigraphy of the subsurface soils encountered in each soil boring is presented in the boring logs (Appendix B). The general subsurface conditions across the site, interpreted from the boring and test pit data (Leighton, 1977) are shown on Plate 2. Three feet of this material was recommended for removal in prior reports prepared by Leighton (1977).

Fernando Formation (Tfsc): The site is geologically mapped as the Fernando Formation (Tfsc), which is described as nonmarine sandstone and conglomerate. The conglomerate within this formation is typically composed of pebbles and cobbles in a friable sandstone matrix. This geologic formation was encountered in all of our geotechnical borings at variable depths, with the shallowest towards the northern portion of the site. Encountered soils within this formation consisted of medium dense to very dense sandstone, which generally classified as Silty Sand.

2.2 Corrosion

Corrosion: In general, soil resistivity, which is a measure of how easily electrical current flows through soils, is the most influential factor for ferrous corrosivity. Based on findings of studies presented in the American Society for Testing and Materials (ASTM) STP 1013 titled “Effects of Soil Characteristics on Corrosion” (February, 1989), an approximate relationship between soil resistivity and soil corrosiveness was developed as shown in Table 1A below.

Table 1A - Soil Corrosivity as a Function of Resistivity

Soil Resistivity (ohm-cm)	Classification of Soil Corrosiveness
0 to 900	Very severe corrosion
900 to 2,300	Severely corrosive
2,300 to 5,000	Moderately corrosive
5,000 to 10,000	Mildly corrosive
10,000 to >100,000	Very mildly corrosive

Sulfate Exposure: Sulfate ions in the soil can lower the soil resistivity and can be highly aggressive to Portland cement concrete by combining chemically with certain constituents of the concrete, principally tricalcium aluminate. This reaction is accompanied by expansion and eventual disruption of the concrete matrix. A potentially high sulfate content could also cause corrosion of reinforcing steel in concrete. Section 1904A of the 2022 California Building Code (CBC) defers to the American Concrete Institute's (ACI's) ACI 318-14 for concrete durability requirements. Table 19.3.1.1 of ACI 318-14 lists "*Exposure categories and classes*," including sulfate exposure as follows:

Table 1B - Sulfate Concentration and Exposure

Soluble Sulfate in Water (parts-per-million)	Water-Soluble Sulfate (SO_4) in soil (percentage by weight)	ACI 318-14 Sulfate Class
0-150	0.00 - 0.10	S0 (negligible)
150-1,500	0.10 - 0.20	S1 (moderate*)
1,500-10,000	0.20 - 2.00	S2 (severe)
>10,000	>2.00	S3 (very severe)

*or seawater

Representative composite, near surface (0 to 5 feet) bulk soil samples obtained for this study were tested to evaluate corrosion potential of material locally derived from the site from previous grading activities (Leighton, 1978). The chemical analysis test results for the onsite soil from our current geotechnical exploration are included in Appendix C of this report and are summarized below.

Table 1C - Corrosivity Test Results

Test Parameter	Test Results	General Classification of Hazard
	LB-2, Sample BB-1	
Water-Soluble Sulfate-SO_4 in Soil (ppm)	136	Negligible sulfate exposure to buried concrete (Exposure Class S0)
Percent by Weight SO_4	0.0136	
Water-Soluble Chloride in Soil (ppm)	50	Non-corrosive to buried concrete (per Caltrans Specifications)
Percent by Weight (Chl^-)	0.005	
pH	7.81	Mildly alkaline
Minimum Resistivity (saturated, ohm-cm)	1,990	Severely corrosive to buried ferrous pipes

Additional corrosion testing should be performed upon completion of grading to confirm the findings and conclusions presented above.

2.3 Expansive Soils

Expansion Index (EI) testing of engineered fill at the completion of grading (Leighton, 1978, Appendix A) below the previously planned lots 1 to 11 and Lots 5 and 10 range from medium expansion (EI=65) to very low (EI=12). Expansion Index testing during investigation of the site (Leighton, 1977) on two samples collected from test pit exploration (TP-3 and TP-11) indicate EI values ranging from 7 to 10 (very low), results are included in Appendix C. Laboratory testing performed during this study on a representative near-surface soil sample within the proposed building footprint indicated an EI of 19 (very low). These combined test results indicate a very low to medium expansion potential for onsite materials. For purposes of this report, the expansion properties of the soil below improvement footprint can be considered as “low”. Additional testing of soils upon completion of grading should be performed to confirm the results of the initial testing.

Based on geotechnical laboratory testing performed on selected soil samples collected from the site and review of previous laboratory test results (Appendix A), a synopsis of geotechnical properties of the site soils is provided in Table 2 below. Geotechnical laboratory testing results are presented in Appendix C, *Laboratory Test Results.*

Table 2 – Soil Geotechnical Properties Synopsis

Parameters	Soil Properties
In-situ Moisture:	Dry to very moist
In-situ Density:	Medium dense to very dense
Swell/Expansion Potential:	Mostly granular, swell/expansion potential is **low**.
Collapse Potential:	Not susceptible to collapse when wetted
Strength:	Adequate to provide structural support
Corrosivity:	No sulfate attack of concrete but **severely corrosive to ferrous metals.**

2.4 Groundwater

Groundwater was not encountered during the current exploration drilled to exploration depths of 36.5 feet bgs. Due to shallow bedrock groundwater is not expected to pose a constraint to construction for the project as currently planned.

2.5 Infiltration

In-situ percolation testing was not performed at the site. However, due to shallow bedrock and clayey low permeability engineered fill below the site, infiltration is not considered geotechnically feasible and is therefore not recommended.

3.0 GEOLOGIC/SEISMIC HAZARDS

Geologic and seismic hazards include surface fault rupture, seismic shaking, liquefaction, seismically-induced settlement, lateral spreading, seismically-induced landslides, flooding, seismically-induced flooding, seiches and tsunamis. The following sections discuss these hazards and their potential impact at the project site.

3.1 Faulting

There are no active or potentially active faults known to cross the project site and the site is not located within an Alquist-Priolo Earthquake Fault Zone (CGS, 1986; Bryant and Hart, 2007) and as such, the potential for surface fault rupture at the site is considered low. However, several active and potentially active faults are mapped within 10 km (6.2 miles) of the site. Figure 4, *Regional Fault and Historical Seismicity Map*, shows the proximity of known active and potentially active faults within the region.

3.2 Liquefaction and Lateral Spreading

Liquefaction is the loss of soil strength due to a buildup of excess pore-water pressure during strong and long-duration ground shaking. Liquefaction is associated primarily with loose (low density), saturated, relatively uniform fine- to medium-grained, clean cohesionless soils. As shaking action of an earthquake progresses, soil granules are rearranged and the soil densifies within a short period. This rapid densification of soil results in a buildup of pore-water pressure. When the pore-water pressure approaches the total overburden pressure, soil shear strength reduces abruptly and temporarily behaves similar to a fluid. For liquefaction to occur there must be:

(1) loose, clean granular soils,

(2) shallow groundwater, **and**

(3) strong, long-duration ground shaking.

Review of both the Earthquake Zones of Required Investigation El Monte Quadrangle, California Geological Survey Zone Map (CGS, 2014) indicate the site is not within an area potentially susceptible to liquefaction (Figure 5, *Seismic Hazard Map*).

With groundwater at a depth greater than 35 feet below grade and relatively medium dense to dense engineered fill overlying hard bedrock below the site, the

potential for liquefaction and related lateral spreading effects on the site is considered very low.

3.3 Seismically-Induced Settlement

Seismically-induced settlement consists of dry dynamic settlement (above groundwater) and liquefaction-induced settlement (below groundwater). These settlements occur primarily within loose to moderately dense sandy soil due to reduction in volume during and shortly after an earthquake event.

We have performed analyses to estimate the potential for seismically induced settlement using the method of Tokimatsu and Seed (1987), and based on Martin and Lew (1999), considering the maximum considered earthquake (MCE) peak ground acceleration (PGA_M). Design/historic high groundwater levels of 100 feet below ground surface were used in the analysis.

Our analysis was adjusted to consider the proposed grade changes for the development as currently planned. Based on our preliminary analysis including building pad preparation recommendations presented in this report, a potential for less than 1 inch of seismic settlement is estimated at the project site. Differential seismic settlement estimated as half of the total settlement results in approximately ½ inch over a distance of 30 feet, or angular distortion of 0.0014L. Results of our seismic settlement analysis is presented in Appendix D, *Seismic Analysis*.

3.4 Seismically-Induced Landslides

The proposed project site is not located in an area mapped as potentially susceptible to seismically-induced landslides (Figure 5, *Seismic Hazard Map*). No landslides are mapped or known to exist at the project site or vicinity. The slopes to the northwest below the water tanks are reported as buttressed with engineered fill (Leighton, 1978). Therefore, the potential for seismically induced landslides to affect the site is very low.

3.5 Flooding

As shown on Figure 6, *Flood Hazard and Dam Inundation Map*, the site is located outside of areas recognized by the Federal Emergency Management Agency (FEMA) to within 0.2% annual flood potential (FEMA, 2008). Earthquake-induced flooding can be caused by failure of dams or other water-retaining structures as a result of an earthquake. As shown on Figure 6, the site is located inside the dam

inundation area of the Garvey Reservoir. Garvey reservoir is classified by the Division of Dam Safety (DSOD) as Dam No. 35-6. Garvey Reservoir is impounded by three embankment dams ranging from 115-foot to 160-foot high with a total length of 5,164 feet. Completed in 1954 the reservoir has a capacity of 1,160 acre feet of treated water. The reservoir regulates flow and pressure for Metropolitan's distribution system. The DSOD classifies it as an extremely high downstream hazard.

According to review of the *General Manager Monthly Report Activities for the Month of June 2021, Metropolitan Water District (MWD) of Southern California*, the Garvey Reservoir is planned for rehabilitation.

Garvey Reservoir Rehabilitation - According to the *Garvey Reservoir rehabilitation Project Proposed Initial Study, Report No. 1642,* prepared by the Metropolitan Water District of Southern California *(*MWD, 2024) the project rehabilitates Garvey Reservoir by replacing the reservoir cover (initially installed in 1999)liner, junction structure valves, and standby generator; relocates the outdated WQ lab; makes structural improvements to the inlet/outlet tower; assesses the need for subdrain systems below the reservoir liner; and evaluates the feasibility of making modifications inside the reservoir to improve mixing within the reservoir. The existing reservoir cover, liner, and supporting facilities have deteriorated and need rehabilitation to protect water quality and maintain reliable water deliveries. Construction activities would take approximately six years to complete with the first phase of work occurring on the cover liner and intake tower (MWD, 2024).

In February 2021, the dam was given a *Satisfactory Condition Assessment* by the State regulatory agency Department of Water Resources, Safety of Dams. No existing or potential dam safety deficiencies are recognized. Acceptable performance is expected under all loading conditions (static, hydrologic, seismic) in accordance with the minimum applicable state or federal regulatory criteria or tolerable risk guidelines.

Therefore, the potential for earthquake-induced flooding at the site is considered low.

3.6 Seiches-Seismically Induced Inundation

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. There are two above ground water tanks located upslope of the

site to the northwest. During seismic events seiches could develop within the water tanks, however design elements such as baffles are required to reduce the potential for seiches in water tanks where overflow or structural failure may result in damage to nearby properties. Criteria for seismic design of water tanks are provided in the American Water Works Association (AWWA) Standards for Design of Steel Water Tanks.

Based on the inland location of the site, tsunami risks are considered negligible.

4.0 FINDINGS AND CONCLUSIONS

Presented below is a summary of findings and conclusions based upon the results of our evaluation of the project site:

- This site is **not** located within a currently designated Alquist-Priolo Special Studies Zone for surface fault rupture. However, as is the case for most of Southern California, strong ground shaking has and will occur at this site. This site is also **not** within a currently designated (March 25, 1998) liquefaction hazard zone. Due to primarily encountered engineered fill, deep groundwater and shallow bedrock, damaging liquefaction and related effects are unlikely to occur at this site. The site is not located in any geologic or seismic hazard zone that could preclude the development of the proposed project.

- Based on review of borings and As-Graded maps (Leighton, 1978) the site is underlain by documented artificial fill (Leighton, 1978) ranging in thickness from 2 to 15± feet overlying bedrock generally consisting of dense to hard sandstone, siltstone and conglomerate. Minor thickness of fill can be expected to vary between explored locations.

- Groundwater was not encountered during the current exploration. Groundwater is not expected to pose a constraint to construction.

- The potential for liquefaction and liquefaction-induced ground failure to occur at the site is considered very low.

- The potential seismically-induced settlement at the site is estimated to be less than 1 inch, with differential seismic settlements of ½ inch over a distance of 30 feet.

- Based on our observations and testing, the onsite soils that will be in contact with the planned structure are expected to have a low expansion potential. Additional testing is recommended at completion of grading. For purposes of design, we recommend using a low expansion index (EI=20 to 50).

- Concrete in contact with the onsite soil is expected to have negligible exposure to water-soluble sulfates (Exposure Class S0) and low exposure to chloride in the soil. The onsite soil, however, is considered severely corrosive to ferrous metal.

- The subsurface materials are anticipated to be readily excavated using conventional earthmoving equipment in good working condition.

- The proposed improvements may be supported on conventional shallow footing foundation systems established on engineered fill.
- Proposed retaining wall systems on the northern and northeastern portions of the site will be cut from existing grade with heights of up to 21 feet. Based on preliminary global stability analyses, a soil nail wall system with adequate nail lengths is recommended to achieve acceptable factors of safety.

Based upon the results of our geotechnical evaluation of the site, the proposed improvements are considered feasible from a geotechnical standpoint.

5.0 RECOMMENDATIONS

The following recommendations have been developed based on the exhibited engineering properties of the onsite soils and their anticipated behavior during and after construction. Recommendations are specifically provided for design of foundations, seismic design considerations, floor slabs, retaining structures, paving, and grading. The proposed structures may be supported on spread-type shallow footing foundation systems established on engineered fill. Leighton should review the grading plan, foundation plans and specifications when they are available to verify that the recommendations presented in this report have been properly interpreted and incorporated. *The local department of building and safety is responsible for implementing the provisions of the applicable building codes. The project would be required to comply with plan review and permitting requirements of the local jurisdiction before the start of construction, as well as comply with the recommendations provided in a final design, and site specific, geotechnical report that is subject to review and approval by the city.*

Loading and bearing pressure diagrams should be provided for our review once prepared to confirm recommendations and settlement estimates remain valid for the project as currently proposed.

5.1 Grading

Project earthwork is expected to include complete demolition/removal of existing surface pavements, building, utilities and complete overexcavation and recompaction of any remaining documented fill soils below new improvement footprints as described in the following subsections.

5.1.1 Site Preparation

After the site is cleared, the soils should be carefully observed for the removal of all unsuitable deposits. We recommend that after removal of pavements and hardscape, and complete demolition of existing structure the subgrade should be evaluated by the engineering geologist.

To reduce the potential for adverse total and differential settlement of the proposed structures, the underlying subgrade soil should be prepared in such a manner that a uniform response to the applied loads is achieved. Due to the potential for near-surface compressible soils, we recommend that onsite soils in the proposed building/structure areas and site walls taller than 5 feet be overexcavated to a minimum depth of 5 feet bgs, or to a depth

of 3 feet below the bottoms of proposed footings, whichever is deeper. Our geotechnical field representative may evaluate earthwork doing grading to reduce the overexcavation requirements if very dense bedrock is encountered.

Where possible, the removal bottom should extend horizontally a minimum of 5 feet from the outside edges of the building/structure footprint and footings (including columns connected to the buildings), or a distance equal to the depth of overexcavation below the footings, whichever is farther. Where this is not achievable, this should be reviewed on a case-by-case basis.

Any underground obstructions encountered should be removed. Those lines should be removed or rerouted where interfering with proposed construction. *According to prior as graded maps (Appendix A) a canyon subdrain was installed in 1978 and prior grading may have included installation of an 8-inch diameter VCP sewer pipe. It is unknown what elevations these utilities lie below the current building footprint. We recommend confirming the presence or absence of these utilities after demolition and prior to full scale grading of the site.*

Areas outside the building, planned for new asphalt and/or concrete pavement, should be over-excavated to a minimum depth of 24 inches below existing or finish grade, or 18 inches below proposed pavement sections, whichever is deeper.

Ancillary structures, such as lightly loaded electrical equipment pads, should be overexcavated to a minimum depth of 2 feet below existing ground or 18 inches below bottom of proposed footings, whichever is greater. Any overexcavation for small, lightly loaded ancillary structures should extend 3 feet horizontally outside the structure limits, where feasible.

Resulting removal excavation bottom-surfaces should be observed by Leighton Consulting, Inc., prior to placement of any backfill or new construction. After these over-excavations are completed, and prior to fill placement, exposed surfaces should be scarified to a minimum depth of 6 inches, moisture-conditioned to or slightly above optimum moisture content, and recompacted (proof rolled) to a minimum 90 percent relative compaction as determined by ASTM D 1557 standard test method (modified Proctor compaction curve).

5.1.2 Earthwork Observation and Testing

Leighton Consulting, Inc. should observe and test all grading and earthwork, to check that the site is properly prepared, the selected fill materials are satisfactory, and that placement and compaction of fills has been performed in accordance with our recommendations and the project specifications. Sufficient notification to us prior to earthwork is essential. Project plans and specifications should incorporate recommendations contained in the text of this report.

Variations in site conditions are possible and may be encountered during construction. To confirm correlation between soil data obtained during our field and laboratory testing and actual subsurface conditions encountered during construction, and to observe conformance with approved plans and specifications, it is essential that we be retained to perform continuous or intermittent review during earthwork, excavation and foundation construction phases. Therefore, conclusions and recommendations presented in this report are contingent upon us performing construction observation services.

5.1.3 Fill Placement and Compaction

Onsite soils free of organics, debris and oversized material (greater-than 6 inches in largest dimension) are suitable for use as compacted structural fill. However, any soil to be placed as fill, whether onsite or imported material, should be first viewed by Leighton and then tested if and as necessary, prior to approval for use as compacted fill. All structural fill must be free of hazardous materials.

All fill soil should be placed in thin, loose lifts, moisture-conditioned, as necessary, to within 2 percent of optimum moisture content, and compacted to a minimum 92% relative compaction as determined by ASTM D 1557 standard test method (modified Proctor compaction curve) within building footprints. Aggregate base for pavement sections should be compacted to a minimum of 95% relative compaction. At least the upper 12 inches of the exposed soils in roadways and access drives, parking lots and (concrete – paver) flatwork areas, should be compacted to at least 95 percent relative compaction based on ASTM Test Method D 1557.

Fill Materials: The onsite soils, less any deleterious material or organic matter, can be used in required fills. Cobbles larger than 6 inches in largest diameter should not be used in the fill. Any required import material should consist of relatively non-expansive soils with a very low to low Expansion Index (EI<50). The imported materials should contain sufficient fines (binder material) so as to be relatively impermeable and result in a stable subgrade when compacted. All proposed import materials should be approved by the geotechnical engineer of record prior to being placed at the site.

Surface Drainage: Water should not be allowed to pond or accumulate anywhere except in detention basins. Pad drainage should be designed to collect and direct surface water away from structures to approved drainage facilities. Hardscape drains should be installed and drain to storm water disposal systems. Drainage patterns approved at the time of fine grading should be maintained throughout the life of proposed structures. Irrigation should not be allowed for at least 10 feet horizontally around buildings.

5.1.4 Reuse of Concrete and Asphalt In Fill

Pulverized demolition concrete free of rebar and other materials and demolished asphalt pavement can be pulverized to particles no-larger-than (≤) 3-inches, and mixed with site soils for use in compacted fill. Blended pulverized concrete and asphalt should be mixed with at least 25% soils by weight. Such materials must be free of and segregated from any hazardous materials and/or organic material of any kind.

5.1.5 Temporary Excavations

All temporary excavations, including utility trenches, retaining wall excavations, and other excavations should be performed in accordance with project plans, specifications and all State of California Occupational Safety and Health Administration (CalOSHA) requirements.

No surcharge loads should be permitted within a horizontal distance equal to the height of cut or 5 feet, whichever is greater from the top of the slope, unless the cut is shored appropriately. Excavations that extend below an imaginary plane inclined at 45 degrees below the edge of any adjacent existing site foundations should be properly shored to maintain support of these structures.

Temporary excavations should be treated in accordance with CalOSHA excavation regulations. The sides of excavations should be shored or sloped accordingly. CalOSHA allows the sides of unbraced excavations, up to a maximum height of 20 feet, to be cut to a ¾:1 (horizontal:vertical) slope for Type A soils, 1:1 for Type B soils, and 1½:1 for Type C soils.

The onsite soils within the proposed overexcavation depths generally conform to CalOSHA Type C soils. Soil type should be evaluated during construction by the designated "competent person" per CalOSHA guidelines. CalOSHA regulations are applicable in areas with no restriction of surrounding ground deformations. Shoring should be designed for areas with deformation restrictions. Heavy construction loads, such as those resulting from stockpiles and heavy machinery, should be kept a minimum distance equivalent to the excavation height or 5 feet, whichever is greater, from the excavation unless the excavation is shored and these surcharges are considered in the design of the shoring system.

5.1.6 Trench Backfill

Pipeline trenches should be backfilled with compacted fill in accordance with this report, and applicable *Standard Specifications For Public Works Construction* (Greenbook), current edition standards. Backfill in and above the pipe zone should be as follows:

- **Pipe Zone**: Any proposed pipe should be placed on properly placed bedding materials. Pipe bedding should extend to a depth in accordance to the pipe manufacturer's specification. The pipe bedding should extend to least 1 foot over the top of the conduit. The bedding material may consist of compacted free-draining sand, gravel, or crushed rock. If sand is used, the sand should have a sand equivalent greater than 30. As an alternate the pipe bedding zone can be backfilled with Controlled Low Strength Material (CLSM) consisting of at least one sack of Portland cement per cubic-yard of sand, conforming to Section 201-6 of the current Edition of the Standard Specifications for Public Works Construction (Greenbook). CLSM bedding should be placed to 1 foot over the top of the conduit, and vibrated. CLSM should not be jetted.

- **Over Pipe Zone**: Above the pipe zone, trenches can be backfilled with excavated on-site soils free of debris, organic and oversized material

larger than 3 inches in largest dimension. As an option, the whole trench can be backfilled with one-sack CLSM same as presented above for the pipe bedding zone. Native soil backfill over the pipe-bedding zone should be placed in thin lifts, moisture conditioned, as necessary, and mechanically compacted using a minimum standard of 92% relative compaction relative to the ASTM D 1557 laboratory maximum dry density within building footprints. The upper 12-inches under hardscape, parking, paver etc. should be compacted to 95% relative compaction.

5.1.7 Corrosion Protection Measures

Water-soluble sulfates in soil can react adversely with concrete. As referenced in the 2022 California Building Code (CBC), Section 1904A, concrete subject to exposure to sulfates shall comply with requirements set forth in ACI 318. Based on laboratory testing results of the onsite soils from recent and prior investigations, concrete structures in contact with the onsite soil will likely have "negligible" exposure to water-soluble sulfates in the soil (Exposure Class S0). Therefore, common Type II Portland cement may be used for concrete construction in contact with site soils. Subgrade soil should be tested for water-soluble sulfate content prior to final design of the concrete structures once grading is complete. Import fill soil should be geotechnically tested for corrosivity and sulfate attack before import to the site. Further testing of import soils, if needed, should include analytical testing for chemicals of concern prior to import and acceptance.

Based on corrosivity test results of the onsite soils, the onsite soil is considered severely corrosive to ferrous metals. Therefore, based on these results, ferrous pipe buried in moist to wet site earth materials should be avoided by using high-density polyethylene (HDPE), polyvinyl chloride (PVC) and/or other non-ferrous pipe when possible. Ferrous pipe can also be protected by polyethylene bags, tap or coatings, di-electric fittings or other means to separate the pipe from on-site soils. A corrosion engineer can be consulted for project-specific corrosion protection measures. Corrosion information presented in this report should be provided to your underground utility subcontractors.

5.2 Foundations

Overexcavation and recompaction of the footing subgrade should be performed as detailed in Section 5.1. The following recommendations are based on the onsite soil conditions and soils with a "low" expansion potential. The proposed new structures may be supported on a shallow spread footing foundation system established on engineered fill.

5.2.1 Shallow Spread Footings

Footings should have a minimum embedment depth of 18 inches, with minimum width of 24 and 12 inches for isolated and continuous footings, respectively.

Bearing Value: An allowable bearing pressure of 2,000 pounds per square foot (psf) may be used, based on an assumed embedment depth of 18 inches and minimum width described above. This allowable bearing value may be increased by 250 psf per foot increase in depth or width to a maximum allowable bearing pressure of 3,500 psf. If higher bearing pressures are required, this should be reviewed on a case-by-case basis and may include additional overexcavation and/or soil reinforcement. These allowable bearing pressures are for total dead load and sustained live loads. Footing reinforcement should be designed by the structural engineer.

Settlement: The recommended allowable bearing pressure is generally based on a total allowable, post-construction static settlement of 1 inch. Differential settlement due to static loading is estimated at ½ inch over a horizontal distance of 30 feet. Since settlement is a function of footing sustained load, size and contact bearing pressure, differential settlement can be expected between adjacent columns or walls where a large differential loading condition exists.

Seismic differential settlement is assumed to be ½ inch over a horizontal distance of 30 feet for the design-level earthquake, or angular distortion of 0.0014L.

Lateral Resistance: Soil resistance available to withstand lateral loads on a shallow foundation is a function of the frictional resistance along the base of the footing and the passive resistance that may develop as the face of the structure tends to move into the soil. The frictional resistance between

the base of the foundation and the subgrade soil may be computed using a coefficient of friction of 0.35. The passive resistance may be computed using an equivalent fluid pressure of 240 pounds-per-cubic-foot (pcf), assuming there is constant contact between the footing and undisturbed soil. The passive resistance can be increased by one-third when considering short-duration wind or seismic loads. The friction resistance and the passive resistance of the soils can be combined without reduction in determining the total lateral resistance.

Uplift Resistance: To evaluate uplift resistance provided by the dead weight of soils above the footing, the frustum of soil above the footing may be estimated by a 30 degree outward projection from vertical. A unit weight of 120 pcf may be used for the soil volume within the frustum.

5.2.2 Modulus of Subgrade Reaction

For foundations established in engineered fill, an initial unit modulus of subgrade reaction (k_1) value of 150 pounds per cubic inch (pci) may be used.

The k_1 value presented herein, which corresponds to a 1-foot-square footing, should be reduced as shown below to incorporate foundation size effects:

$$k = k_1 \left(\frac{B+1}{2B}\right)^2$$

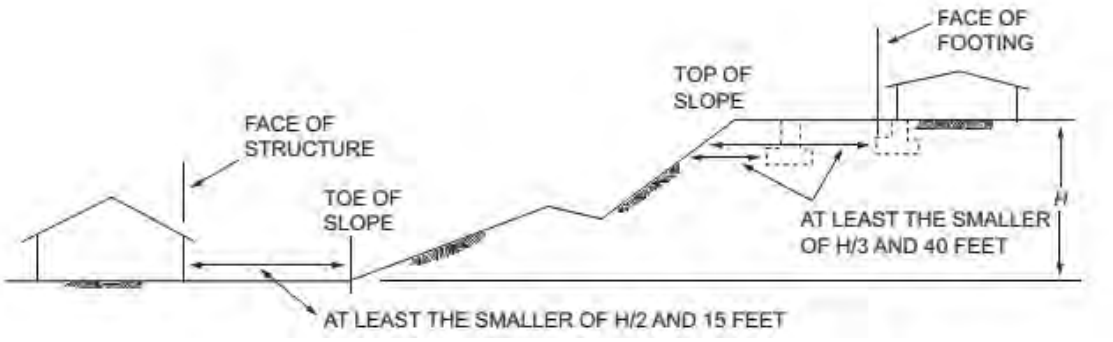
where B is the square footing width.

5.2.3 Flagpole-Type Foundations

The following recommendations are applicable for light poles and shade structures/canopies. If large light structure, such as Musco light poles, are planned, then Leighton should review the proposed lighting system and provide supplemental recommendations if required. Similarly, if large shade structures are planned, then Leighton should review the proposed structure systems.

For enhanced sliding and overturning resistance, light poles are often founded on drilled cast-in-place reinforced concrete piers. Therefore, we

present geotechnical design parameters for drilled cast-in-place concrete piers to support new light poles.



Lateral bearing resistance for proposed light pole pile foundations may be based on allowable lateral earth pressure of Class of Material 5 on Table 1806A.2 of the 2022 CBC, which can be doubled in accordance with 1806A.3.4, ignoring the upper 18 inches of soil in non-paved areas. This lateral bearing value assumes that the pole can tolerate at least a 0.5-inch deflection at the ground surface due to short term loading. Lateral bearing resistance should be computed in accordance with Section 1807A.3.2.1 (unconstrained laterally) of the 2022 CBC.

These recommendations assume that the foundations will be embedded against firm intact soil.

For axial design, we recommend an allowable resistance in compression for these foundations consisting of 200 psf for allowable skin friction, ignoring the bottom one diameter, and an allowable end bearing of 2,500 psf (assuming a cleaned-out bottom). We recommend that the piles be at least 4 pile diameters long. These values are for isolated single piles.

5.2.4 Building Clearance and Foundation Setbacks

All building foundations located near slopes should have a minimum setback per Figure 1808.7.1 of the 2022 California Building Code (CBC). Setback distances should be measured from competent material extending perpendicular to the slope face.

As a minimum, building clearances from the toe of an ascending slope should be equal to one-half of the total slope height (H/2) to a maximum setback of 15 feet per the 2022 CBC section 1808.7.1. and Figure 1808.7.1.

5.3 Seismic Design Parameters

We performed a Site Class analysis in general accordance with ASCE 7-16 analysis with field Standard Penetration Blowcounts (SPT) from the geotechnical borings that extended to a maximum depth of 36.5 feet below existing grade, and considered the proposed site grade adjustments. The western and eastern portion of the proposed building will require approximately 8 feet of fill and 11 feet of cut to reach proposed grades, respectively.

Considering the geotechnical boring with the deepest depth of competent bedrock (Boring LB-2), the site classifies as Site Class D. However, other borings at the site encountered relatively shallow bedrock which resulted in classification as Site Class C. Therefore, we are including seismic parameters for both Site Class D and C for structural evaluation.

The tables below list seismic design parameters for both Site Class C and D based on the 2022 CBC, Section 1613A.3 (ASCE 7-16) methodology:

Table 3A - 2022 CBC Mapped Seismic Parameters – Site Class "C"

Categorization/Coefficients	Code-Based (1) (2)
Site Longitude (decimal degrees) West	-118.1141
Site Latitude (decimal degrees) North	34.0402
Site Class	C
Mapped Spectral Response Acceleration at 0.2s Period, S_s	1.918
Mapped Spectral Response Acceleration at 1s Period, S_1	0.689
Short Period Site Coefficient at 0.2s Period, F_a	1.200
Long Period Site Coefficient at 1s Period, F_v	1.400
Adjusted Spectral Response Acceleration at 0.2s Period, S_{MS}	2.302
Adjusted Spectral Response Acceleration at 1s Period, S_{M1}	0.965
Design Spectral Response Acceleration at 0.2s Period, S_{DS}	1.534
Design Spectral Response Acceleration at 1s Period, S_{D1}	0.643
Design Peak Ground Acceleration, PGA_M	0.993

1. All were derived from the SEA web page: https://seismicmaps.org/
2. All coefficients in units of g (spectral acceleration)
3. See Appendix D for details of the seismic evaluation.

Table 3B - 2022 CBC Mapped Seismic Parameters – Site Class "D"

Categorization/Coefficients	Code-Based (1) (2)
Site Longitude (decimal degrees) West	-118.1141
Site Latitude (decimal degrees) North	34.0402
Site Class	D (5)
Mapped Spectral Response Acceleration at 0.2s Period, S_s	1.918
Mapped Spectral Response Acceleration at 1s Period, S_1	0.689
Short Period Site Coefficient at 0.2s Period, F_a	1.000
Long Period Site Coefficient at 1s Period, F_v	1.700
Adjusted Spectral Response Acceleration at 0.2s Period, S_{MS}	1.918
Adjusted Spectral Response Acceleration at 1s Period, S_{M1}	1.171 (4)
Design Spectral Response Acceleration at 0.2s Period, S_{DS}	1.279
Design Spectral Response Acceleration at 1s Period, S_{D1}	0.781 (4)
Design Peak Ground Acceleration, PGA_M	0.910

1. All were derived from the SEA web page: https://seismicmaps.org/
2. All coefficients in units of g (spectral acceleration)
3. See Appendix D for details of the seismic evaluation.
4. See Section 11.4.8 of ASCE 7-16. A site-specific ground motion hazard analysis in accordance with Section 21.2. of ASCE 7-16 is required for this site. **Per Supplement 3 to ASCE 7-16, a site-specific ground motion hazard analysis is not required where the value of the parameters SM_1 and SD_1 in the table are increased by 50%.**
5. Site Class D, and all of the resulting parameters in this table, may only be used for structures without seismic isolation or seismic damping systems.

The project structural engineer should review the seismic parameters.

5.4 Slabs-on-Grade

Concrete slabs-on-grade should be designed by the structural engineer in accordance with 2022 CBC requirements for soils with a low expansion potential. More stringent requirements may be required by the structural engineer and/or architect; however, slabs-on-grade should have the following minimum recommended components:

- **Subgrade:** The near-surface clayey soils can be expansive and will shrink and swell with changes in the moisture content. Therefore, floor slabs-on-grade and adjacent concrete flatwork should be underlain by at least 18 inches of relatively non-expansive fill (EI<20). Expansion Index tests performed during this study in the area of the proposed building indicated an EI of 19 ("very low").

Existing soils are anticipated to be relatively non-expansive, however this should be further evaluated during earthwork construction. Accordingly, removal and replacement with non-expansive fill will likely not be required.

Slab-on-grade subgrade soil should be moisture conditioned to or within 3% over optimum moisture content, to a minimum depth of 18 inches within building footprints, and compacted to 92% of the modified proctor (ASTM D 1557) laboratory maximum density prior to placing either a moisture barrier, steel and/or concrete. Onsite soil may be suitable for this use; however additional expansion testing should be performed upon completion of grading to verify expansive properties of onsite soil.

- **Moisture Barrier:** A moisture barrier consisting of at least 15-mil-thick Stego-wrap vapor barriers (see: http://www.stegoindustries.com/products/stego_wrap_vapor_barrier.php), or equivalent, should then be placed below slabs where moisture-sensitive floor coverings or equipment will be placed.

- **Reinforced Concrete**: A conventionally reinforced concrete slab-on-grade with a thickness of at least 5 inches should within the building footprint and 5-inches for exterior slab on grade (SOG) be placed in pedestrian areas without heavy loads. Reinforcing steel should be designed by the structural engineer, but as a minimum should be No. 3 rebar placed at 18 inches on-center, each direction (perpendicularly), mid-depth in the slab.

  Minor cracking of concrete after curing due to expansion, drying and shrinkage is normal and will occur. However, cracking is often aggravated by a high water-to-cement ratio, high concrete temperature at the time of placement, small nominal aggregate size, and rapid moisture loss due to hot, dry, and/or windy weather conditions during placement and curing. Cracking due to temperature and moisture fluctuations can also be expected. The use of low-slump concrete or low water/cement ratios can reduce the potential for shrinkage cracking.

5.4.1 Utilities and Trenches

Where existing pipes cross under footings the footings shall be specifically designed by the engineer in charge. Pipe sleeves shall be provided where pipes cross through footings or footing walls and sleeve clearances shall be designed to account for potential settlement of not less than 1 inch around

the pipe. Alternate and approved clearances can be provided by the design professional in charge of the utility.

5.5 Lateral Earth Pressures

Recommended lateral earth pressures are provided as equivalent fluid unit weights, in psf/ft. or pcf. These values do not contain an appreciable factor of safety, so the structural engineer should apply the applicable factors of safety and/or load factors during design.

On-site soils are likely suitable to be used as retaining wall backfill due to its relatively low expansion potential, field and laboratory verification recommended before use. Should site soil be desired for reuse behind retaining walls, if any, the material should be tested to ensure Expansion potential is less than 30 (EI<30). Recommended lateral earth pressures for retaining walls backfilled with sandy soils with drained conditions are as follows:

Table 4 - Retaining Wall Design Earth Pressures

Retaining Wall Condition (Level Backfill)	Equivalent Fluid Pressure (pounds-per-cubic-foot)*
Active (cantilever)	40
At-Rest (braced)	60
Passive Resistance (compacted fill)	240
Seismic Increment (add to active pressure)	31

*Only for level and drained properly compacted backfill

Walls that are free to rotate or deflect may be designed using active earth pressure. For the basement walls or walls that are fixed against rotation, the at-rest pressure should be used. For seismic condition, the pressure should be distributed as an inverted triangular distribution and the dynamic thrust should be applied at a height of 0.6H above the base of the wall.

Retaining Wall Surcharges: Vertical surcharge loads behind a retaining wall on or in backfill within a 1:1 (horizontal:vertical) plane projection up and out from the retaining wall toe, should be considered as lateral and vertical surcharge. Unrestrained (cantilever) retaining walls should be designed to resist one-third of these surcharge loads applied as a uniform horizontal pressure on the wall. Braced walls should also be designed to resist an additional uniform horizontal-pressure equivalent to one-half of uniform vertical surcharge loads.

In areas where autos and pickup trucks will drive we suggest assuming a uniform vertical surcharge of 300 psf, which would result in active and at-rest horizontal surcharges of 100 psf and 150 psf, respectively. This should be doubled in areas of heavy construction traffic (such as concrete trucks, heavy equipment delivery-trucks, etc.). If crane outrigger loads or other point load sources are applied as wall surcharge, this will require additional analyses based on load source and location relative to the wall.

5.5.1 Sliding and Overturning Total depth of retained earth for design of walls and for uplift resistance, should be measured as the vertical height of the stem below the ground surface at the wall face for stem design, or measured at the heel of the footing for overturning and sliding. A soil unit weight of 120 pcf may be assumed for calculating the actual weight of the soil over the wall footing, if drained, or 60 pcf if submerged, for properly compacted backfill.

5.5.2 Drainage

Adequate drainage may be provided by a subdrain system positioned behind the walls. Typically, this system consists of a 4-inch minimum diameter perforated pipe placed near the base of the wall (perforations placed downward). The pipe should be bedded and backfilled with pervious backfill material described in Section 300-3.5.2 of the Standard Specifications for Public Works Construction (Green Book), Current Edition. This pervious backfill should extend at least 2 feet out from the wall and to within 2 feet of the outside finished grade. This pervious backfill and pipe should be wrapped in filter fabric, such as Mirafi 140N or equivalent, placed as described in Section 300-8.1 of the Standard Specifications for Public Works Construction (Green Book). The subdrain outlet should be connected to a free-draining outlet or sump.

Miradrain, Geotech Drainage Panels, or Enkadrain drainage geocomposites, or similar, may be used for wall drainage as an alternative to the Class 2 Permeable Material or drain rock backfill, particularly where horizontal space is limited adjacent to shoring (where walls are cast against shoring). These drainage panels should be connected to the perforated drainpipe at the base of the wall.

5.6 Soil-Nail Retaining Walls

Retaining walls with heights of up to 21 feet are currently proposed on the northern and northeastern portions of the site. Based on the design cut to reach proposed grades, we assume that the retaining wall system would be constructed with soil-nails. Proposed walls include an approximate 1.5H:1V to 2H:1V slope above the wall, extending to the property line.

Soil nail wall systems are advantageous in that they can be constructed in a top-down manner, considering the need for cuts into the existing slope. Based on Caltrans geotechnical manual guidelines, a minimum soil nail length of 15 feet was considered.

Preliminary analysis of global stability using limit equilibrium (i.e. slope stability) techniques was performed on three sections (Section B, D, and E) of the proposed retaining wall. The resultant soil nail lengths to achieve acceptable factors of safety range from approximately 29 to 39 feet (approximately 1.6 to 2.1 times the height of the wall). Our global stability analyses are summarized below.

Table 5 – Soil Nail Wall Global Stability Summary

Section	Wall Height (ft)	Soil Nail Rows	Soil Nail Length	Factor of Safety	
				Static	Pseudo Static
B-B	21	5	39 (top two rows) 35 (remaining)	1.54	1.19
D-D	18	4	34 (top two rows) 29 (remaining)	1.58	1.19
E-E	15	3	32	1.53	1.10

Soil nails were located a minimum of 2.5 feet below the top of wall. Global stability analysis for the proposed retaining wall are included in Appendix D. The following sections include design recommendations for the proposed retaining wall.

5.6.1 Soil Nail Wall Configuration

Based upon the materials that are anticipated to be exposed during cutting and wall construction, the maximum vertical cut performed during nail installation is recommended to be 5 feet. The minimum horizontal spacing of the soils nails is recommended to be 4 feet but should not exceed 5 feet. The rows of soil nails are recommended to be installed 2½ feet from the top

of wall, and 2 to 3 feet from the bottom. In addition, nails are recommended to be located no closer than 2½ feet from the ends of the wall. For wall sections under 4.5 feet in height from top of bottom of wall, soil-nails should be centered in the soil cut face. The minimum soil nail length is recommended to be 15 feet. Table 5 provides the minimum soil nail lengths for the wall heights and configurations modeled in order to achieve acceptable global stability factors of safety.

Per Caltrans geotechnical manual guidelines, we recommend that the soil nail reinforcement be composed of No. 8 Grade 75 steel bars.

5.6.2 Pullout Resistance

Pullout resistance used in design depends upon the material in which the nails will be embedded and the manner in which nail construction will be performed. Inclined soil nails constructed by typical gravity flow of grout placement may be analyzed using an assumed design ultimate bond stress of 900 lbs/ft in the encountered fill and 1,100 lbs/ft within granular Fernado Formation bedrock. Bond stress values were derived based on general parameters and soil types shown on Table 4.4 of FHWA guidance documents (FHWA, 2015).

5.6.3 Bearing Capacity and Sliding Resistance

Bearing capacity is not anticipated to be a significant design consideration for the proposed soil nail walls. Evaluation of bearing capacity as part of wall design may be based upon an allowable bearing resistance of 1,000 psf.

Resistance to sliding should be evaluated solely on the sliding resistance of the bearing soils. The coefficient of sliding friction for use in design is recommended to be 0.35.

5.6.4 Wall Drainage

Design of the wall is based upon the presumption of drained soil conditions behind the wall and no additional load demand from the accumulation of water behind the wall. Therefore, an appropriate permanent drainage systems will be required that includes proper connection to a conveyance system to properly discharge water to the storm drain or other device.

The top-down manner in which the wall will be constructed requires the installation of the drainage system during construction of each section of wall as construction proceeds. A drainage system consisting of a geo-composite (e.g., drainboard) is expected to be a feasible alternative.

Vertical drainage panels can be installed as strips between rows of soil nails. The drainage panels should be connected at the base of the wall and outlet to a collective drainage system or to weepholes near the base of the wall. Panel drains should be terminated near the top of the wall and should not be exposed above the top of wall.

5.6.5 Excavation Stability

Field testing may be required to demonstrate the stability of excavation lift height and exposure duration in areas where the maximum lift height exceeds 5 feet or an exposure duration longer than one (1) work shift. When stability testing is not performed, shotcrete should be applied during the same work shift in which excavation has occurred. Completion of the shotcrete facing may be delayed up to 24 hours if the contractor demonstrates that the integrity of the excavated face is maintained.

Stability tests should be conducted by performing staged excavation to produce a neat excavated face no more than 5 feet in front of the location of the final wall face. The height of the excavated face should be as specified in the approved working drawings. The excavated face should be 20 feet long and parallel to the wall alignment. The excavated face should have a constant height within the 20-foot section. Ramps may be excavated outside the 20-foot section to provide construction access. The excavated face should be left open for the duration specified in the approved working drawings.

The excavated face must maintain its integrity without raveling, sloughing, or measurable lateral movement at the completion of the stability test. After written approval by the Engineer, the proposed excavation height may be used in that wall zone as the stand-up height of the excavated face for the duration observed in the stability test.

If at any time the exposed excavated face fails to maintain its integrity without raveling, sloughing, or measurable lateral movement for the duration of time observed in the approved stabilization test, the contractor

should immediately stabilize the excavated face and perform additional stability testing as described herein.

5.6.6 Load Testing

Verification and proof testing should be performed on soil nails to verify pullout capacity and bond strength of the soil-nail interface. Tests should be performed during installation in accordance with FHWA guidelines. FHWA recommends proof testing on at least 5 percent of production soil nails in each nail row, and a minimum of one per row.

5.6.7 Corrosion Protection

The results of corrosivity testing performed on representative samples of the material encountered at the boring locations indicates a moderate potential exists for corrosion to occur. The cement grout used to secure the nails in the boreholes will provide both physical and chemical corrosion protection. In addition, the bars are recommended to be epoxy coated and encapsulated with a corrugated plastic sheathing. The grout that fills the annular area around the steel bar should be low in permeability and provide a minimum 1-inch cover.

5.7 Pavement Design

To provide support for paving, the subgrade soils should be prepared as recommended in Section 5.1, Grading. Compaction of the subgrade, including trench backfills, to at least 92 and 95 percent as recommended relative compaction based on ASTM Test Method D 1557 and achieving a firm, hard and unyielding surface will be important for paving support. The upper 12-inches of pavement subgrade should be compacted to 95% relative compaction. The preparation of the paving area subgrade should be performed immediately prior to placement of the base course. Proper drainage of the paved areas should be provided since this will reduce moisture infiltration into the subgrade and increase the life of the paving.

All pavement construction should be performed in accordance with the Standard Specifications for Public Works Construction or Caltrans Specifications. Field observations and periodic testing, as needed during placement of the base course materials, should be undertaken to ensure that the requirements of the standard specifications are fulfilled.

5.7.1 Base Course

The base course for both asphalt concrete and Portland Cement Concrete paving should meet the specifications for Class 2 Aggregate Base as defined in Section 26 of the latest edition of the State of California, Department of Transportation, and Standard Specifications. Alternatively, the base course could meet the specifications for untreated base as defined in Section 200-2 of the latest edition of *Standard Specifications for Public Works Construction* (Greenbook). Crushed Miscellaneous Base (CMB) may be used for the base course provided the geotechnical consultant evaluates and tests it before delivery to the site as CMB tends to result in a thicker support section than crushed aggregate base.

5.7.2 Asphalt Concrete

The required asphalt paving and base thicknesses will depend on the expected wheel loads and volume of traffic (Traffic Index or TI). Onsite near-surface soils consisted of clayey/silty sands and sandy clay. Laboratory testing performed on a near-surface clayey bulk sample yielded an R-Value of 18. Assuming that the paving subgrade will consist of similar soils compacted to at least 92 percent relative compaction based on ASTM Test Method D 1557 below 12-inches and 95% relative compaction in the upper 12-inches, the minimum recommended paving thicknesses are presented in the following table:

Area	Traffic Index	Asphalt Concrete (inches)	Base Course (inches)
Light Truck	5	3.0	7.5
Heavy Truck	6	3.5	10.0
Main Drives	7	4.0	12.5

The asphalt paving sections were determined using the 2017 Caltrans design method using assumed Traffic Index values. We can determine the recommended paving and base course thicknesses for other Traffic Indices if required. Careful inspection is recommended to verify that the recommended thicknesses or greater are achieved, and that proper construction procedures are followed.

5.7.3 Portland Cement Concrete Paving

For onsite Portland Cement Concrete (PCC) pavement in truck drive aisles and parking areas, we recommend a minimum of 6.5-inch-thick concrete with dowels at joints, placed on compacted fill subgrade, with the upper 8 inches compacted to a minimum of 95 percent relative compaction. In areas with car traffic only, we recommend a minimum of 5-inch-thick concrete, placed on compacted fill subgrade with the upper 8 inches compacted to a minimum of 95 percent relative compaction.

The PCC pavement sections should be provided with crack-control joints spaced no more than 14 feet on center each way for 6.5-inch-thick concrete, and 12 feet for 5-inch-thick concrete. If sawcuts are used, they should have a minimum depth of ¼ of the slab thickness and made within 24 hours of concrete placement.

5.8 Geotechnical Services During Construction

Our geotechnical recommendations are contingent upon Leighton Consulting, Inc., providing geotechnical observation and testing services during earthwork and foundation construction. There is a potential for encountering deeper fill, underground obstructions or otherwise unacceptable existing soils between or beyond our boring locations. We are unaware of any existing fill placement documentation for the engineered fill placed in 1971 for this site. Therefore, inconsistent existing fill materials may be encountered in the canyon backfill during construction, possibly requiring revised geotechnical recommendations.

Our geotechnical recommendations provided in this report are based on information available at the time the report was prepared and may change as plans are developed. Additional geotechnical exploration, testing and/or analysis may be required based on final plans. Leighton Consulting, Inc. should review site grading and foundation plans when available, to comment further on geotechnical aspects of this project and check to see general conformance of final project plans to recommendations presented in this report.

Leighton Consulting, Inc. should be retained to provide geotechnical observation and testing during excavation and all phases of earthwork. Our conclusions and recommendations should be reviewed and verified by us during construction and revised accordingly if geotechnical conditions encountered vary from our findings and interpretations. Geotechnical observation and testing should be provided:

- During all excavation,
- During compaction of all fill materials,
- After excavation of all footings and prior to placement of concrete,
- During utility trench backfilling and compaction,
- During pavement subgrade and base preparation, and/or
- If and when any unusual geotechnical conditions are encountered.

6.0 LIMITATIONS

Leighton's work was performed using the degree of care and skill ordinarily exercised, under similar circumstances, by reputable geotechnical consultants practicing in this or similar localities. No other warranty, express or implied, is made as to the conclusions and professional opinions included in this report. As in many projects, conditions revealed in excavations may be at variance with our current findings. If this occurs, the changed conditions must be evaluated by the geotechnical consultant and additional recommendations be obtained, as warranted.

The identification and testing of hazardous, toxic or contaminated materials were outside the scope of Leighton's work. Should such materials be encountered at any time, or their existence is suspected, all measures stipulated in local, county, state and federal regulations, as applicable, should be implemented.

This report is issued with the understanding that it is the responsibility of the owner or a duly authorized agent acting on behalf of the owner, to ensure that the information and recommendations contained herein are brought to the attention of the necessary design consultants for the project and incorporated into the plans; and that the necessary steps are taken to see that the contracts carry out such recommendations in the field.

The findings of this report are considered valid as of the present date. However, changes in the condition of a property can occur with the passage of time, whether due to natural processes or the work of man on the subject or adjacent properties. In addition, changes in standards of practice may occur from legislation or the broadening of knowledge. Accordingly, the findings of this report may at some future time be invalidated wholly or partially by changes outside Leighton's control.

The conclusions and recommendations in this report are based in part upon data that were obtained from a necessarily limited number of observations, site visits, excavations, samples and testes. Such information can be obtained only with respect to the specific locations explored, and therefore may not completely define all subsurface conditions throughout the site. The nature of many sites is that differing geotechnical and/or geological conditions can occur within small distances and under varying climatic conditions. Furthermore, changes in subsurface conditions can and do occur over time. Therefore, the findings, conclusions, and recommendations presented in this report should be considered preliminary if unanticipated conditions are encountered and additional explorations, testing and analyses may be necessary to develop alternative recommendations.

This report has been prepared for the express use of SDCF Monterey Park, LLC and its design consultants, and only as related expressly to the assessment of the geotechnical constraints of developing the subject site and for construction purposes. This report may not be used by others or for other projects without the express written consent of SDCF Monterey Park, LLC and our firm.

If parties other than Leighton are engaged to provide construction geotechnical services, they must be notified that they will be required to assume complete responsibility for the geotechnical phase of the project by concurring with the findings and recommendations in this report or by providing alternative recommendations. Any persons using this report for bidding or construction purposes should perform such independent investigations as they deem necessary to satisfy themselves as to the surface and/or subsurface conditions to be encountered and the procedures to be used in the performance of work on the subject site.

SUBJECT: Geotechnical Report of Rough Grading,
Tract 33910 and Parcel Map 10094,
City of Monterey Park, California

Introduction

In accordance with your authorization of July 14, 1978, we have provided the required geotechnical inspection, testing and mapping during rough grading of the subject areas.

Our services were performed in conformance with the City of Monterey Park requirements.

The purpose of this report is to summarize the geotechnical conditions of the area and to present our recommendations for future construction.

The 40-scale Grading Plan (Sheets 2 and 3 of 3) prepared by Lockman and Associates served as the base for the accompanying As-Graded Geotechnical Map.

Accompanying Map and Appendices

As-Graded Geotechnical Map (40-scale) - In Pocket
Appendix A - Preliminary Foundation Recommendations
Appendix B - Laboratory Test Data
Appendix C - Summary of Field Density Tests
Appendix D - Geotechnical Reports Referenced

Summary of Grading

Rough grading commenced on July 10, 1978 and was completed on October 5, 1978.

Site Preparation

Trash and heavy brush were removed from the site prior to grading. An average depth of 3 feet of unsuitable material was removed prior to fill placement from the drainage area located between Lots 2 and 11.

Fill Placement

Fill materials were spread in level lifts approximately 8 inches in thickness. Moisture was added as necessary by a water truck and the fill materials were mixed to a uniform moisture. Compaction of each lift was then completed through the use of double 5x5 sheepsfoot compactors and self-powered compaction equipment in advance of further fill placement. Fill slopes were either backrolled with a sheepsfoot roller at 4-foot vertical intervals or overfilled and cut back to expose the compacted inner core.

Repair of Previously Existing Slopes

The slopes to the rear of Parcels 2 and 3 of Parcel Map 10094 were repaired as recommended in our report of December 21, 1977 (Referenced Report 2 of Appendix D).

Inspection and Testing

Soil engineering inspection and testing of grading operations was performed full time. Geologic inspection and mapping was conducted periodically as necessary. The standard used for the minimum compaction requirement was 90 percent of ASTM Test Method D1557-70. Field density tests were taken by the Sand Cone Method (ASTM Test Method D1556-64) and the Drive Cylinder Method (ASTM Test Method D2937-71). The approximate locations of tests taken are shown on the accompanying As-Graded Geotechnical Map. Summary sheets of the density tests taken on the project are submitted as Appendix C. Soil types with maximum density and optimum moisture percentage are presented as Appendix C.

Expansion Index Tests (UBC Standard 29-2) were performed on typical materials from the pad areas and low expansion was exhibited in these areas. All lots were sampled and soils were compared texturally to determine in which expansion category they were to be placed.

Summary of Geologic Conditions

The earth materials exposed during grading operations consisted of sedimentary bedrock consisting of sandstone, siltstone and conglomerate.

No landslides or major faulting were exposed by the grading operations.

Adversely-oriented bedding required buttresses to be constructed for support of the cut slopes located southeast of Lots 6 and 10, Tract 33910. The approximate location of the buttress keys and subdrains are shown on the accompanying map.

Four 2 to 3-inch thick clay beds are exposed in portions of Lots 2, 3, 10 and 11 of Tract 33910 as shown on the accompanying map.

Subdrains

The subdrain which was reported to have been installed under the existing fill of the tract north of Lot 2, Tract 33910 could not be located with extensive backhoe probes. An observation well was provided. The approximate location of this well is shown on the accompanying map.

Subdrains were constructed in the buttress fills and are shown on the accompanying map.

Groundwater

Seepages were encountered during excavation of the cut slope to the rear of Lot 1, Tract 33910 and Parcel 3 of Parcel Map 10094, along the property line of Lots 2 and 3, Tract 33910 and in the northeast end of the buttress excavation, Lot 6, Tract 33910.

The seepages in the cut slope have essentially dried up with two minor wet areas remaining as shown on the accompanying map.

It is anticipated that the seepages on the property line of Lots 2 and 3 of Tract 33910 will dry and present no further problems. However, these areas should receive additional evaluation if building foundations or pavement are planned over the moist areas.

The buttress subdrain was extended to drain the seep exposed by the buttress excavation to the rear of Lot 6.

CONCLUSION AND RECOMMENDATIONS

Conclusion

Rough grading was accomplished in a workmanlike manner, in accordance with the requirements of the City of Monterey Park and our recommendations.

Recommendations

1. Foundation recommendations presented in Appendix A are necessarily tentative and preliminary as building layouts, types of construction and building locations are unknown. When these parameters are determined, they should be reviewed by the soil engineer for final foundation recommendations.

   Special foundation requirements may be necessary where foundations cross clay beds or are founded upon both cut and fill.

2. Slopes, both cut and fill, should perform satisfactorily when properly planted and maintained. Positive surface drainage away from the tops of slopes should be maintained.

3. Utility trench backfill should be placed as presented in Referenced Report 1 of Appendix D.

4. Pavement Sections

   Two representative samples were tested for their "R"-Value (Appendix B). In general, the clayey sand with traces of gravel material on the site yield moderate "R"-Values (34 to 37).

   Recommended street, driveway and parking lot sections are 3 inches AC on 4 inches of aggregate base.

   Sections at driveway entrances and service areas with frequent truck traffic should be increased by 2 to 3 inches of additional aggregate base.

   Prior to placement of base, the upper 8 inches of subgrade in bedrock areas must be thoroughly scarified or excavated and recompacted to minimize differential effects of the bedded materials. This subgrade should be moisture conditioned and then compacted to a minimum of 90 percent relative compaction.

5. Observation well should be monitored through one storm season to detect potential presence of free water. Results of the monitoring will determine future disposition of the well. A more permanent cover should be installed on the well to enable the monitoring and maintain security.

6. Construction should be inspected at the following stages by the soil engineer:

   A. After preparation of building plans.

   B. After excavation of foundation trenches.

   C. During backfilling of deep construction. Prior to paving or other construction over shallow backfill.

   D. After compaction of street subgrade and base.

   E. When any unusual conditions are encountered during construction.

Respectfully submitted,

David A. Adams
Project Geologist

APPENDIX A

APPENDIX A

PRELIMINARY FOUNDATION RECOMMENDATIONS

1. Footing Type

   Shallow square or continuous-type footings are suitable for support of light to medium construction.

2. Footing Embedment Minimum

   One-story or equivalent construction - 12 inches
   Two-story or equivalent construction - 18 inches
   Interior Footing (with minimum
   4-inch slab around footing) - 12 inches
   Exterior Column Footing - 18 inches

3. Minimum Reinforcing of Continuous-Type Footings*

   One No. 4 bar in both top and bottom.

   *Structural consideration may require additional reinforcing.

4. Maximum Allowable Soil Bearing Pressure*

   12-inch minimum embedment - 1500 psf
   18-inch minimum embedment - 2000 psf

   *Increases in bearing pressure may be permissible for extra embedment or footing on bedrock.

5. Slab Thickness Minimum

   4 inches. Additional thickness may be necessary due to special structural considerations.

6. Minimum Slab Reinforcing

   6x6-10/10 WWF carefully placed at the center of the slab thickness. Additional reinforcing may be necessary due to special structural considerations.

48	7/24	N27015, E53580	1	366	119.8	129.0	11.0	8.0	93

Field density tests were performed in accordance with ASTM D1556-64
* Denotes Driven Sampler Method of Testing, ASTM D2937-71
Maximum densities and optimum moistures were determined in accordance with ASTM D1557-70
Form 202A (8/77)

Appendix B.3 – Test Pits (1977)

APPENDIX A

GEOTECHNICAL TRENCH LOGS

TRENCH 1 - Parcel 1

0 to 4 feet - FILL, SILTY SAND WITH GRAVEL: Damp, light brown to tan, pieces of gray sandstone, dense. (SM)

4 to 12.5 feet - ALLUVIUM, CLAYEY SILTY SAND WITH GRAVEL: Dry to damp, dark brown, highly porous with root hairs, moist below 7 feet--still porous, loose to medium-dense with depth. (SM)

12.5 to 14 feet - BEDROCK, SANDSTONE: Damp to moist, rusty brown, dense. (SM)

TRENCH 2 - Parcel 3

0 to 7 feet - BEDROCK, SANDSTONE: Damp, yellow/orange, 5-inch pebble/cobble conglomerate interbedded, very dense, bedding: N85°W, 40°SW. (SW)

TRENCH 3 - Lot 1

0 to 1.5 feet - FILL, CLAYEY SILTY SAND WITH GRAVEL: Dry, brown, very loose. SC

1.5 inches to 3.5 feet - BEDROCK; CLAYEY SAND AND GRAVEL WITH COBBLE TO 6 INCHES: Moist, rusty brown, very dense. SW-SC

TRENCH 4 - Lot 2

0 to 2 feet - ALLUVIUM, CLAYEY SILTY SAND WITH GRAVEL: Dry to damp, dark brown, loose. (SM)

2 to 3.5 feet - BEDROCK, CLAYEY SAND AND GRAVEL WITH COBBLE TO 6 INCHES: Damp to moist, rusty brown, dense. (SC)

TRENCH 5 - Lot 2

0 to 4.5 feet - ALLUVIUM, CLAYEY SILTY SAND WITH GRAVEL: Dry, dark brown, highly porous with root hairs, loose, damp and very dense from 2 feet to 4.5 feet. (SM)

4.5 to 5.5 feet - ALLUVIUM, COARSE SAND AND GRAVEL: Damp, tan, dense. (SP)

APPENDIX A

GEOTECHNICAL TRENCH LOGS (CONTINUED)

TRENCH 5 (Continued)

5.5 to 6 feet 4 inches - ALLUVIUM, CLAYEY SILTY FINE SAND: Moist, light brown, dense. (SC)

6 feet 4 inches to 7 feet 4 inches - ALLUVIUM, COARSE SAND AND GRAVEL: Moist, light brown, dense. (SP)

7 feet 4 inches to 7 feet 8 inches - BEDROCK, SANDSTONE: Medium brown, medium dense. (SW)

TRENCH 6 - Lot 7

0 to 2 feet - BEDROCK CLAYEY SAND AND GRAVEL WITH COBBLE TO 6 INCHES: Moist, rusty brown, dense to very dense. (SC)

TRENCH 7 - Lot 5

0 to 2 feet - BEDROCK, CLAYEY SAND AND GRAVEL WITH COBBLE TO 6 INCHES: Moist, rusty brown, dense to very dense. (SC)

TRENCH 8 - Lot 8

0 to 5.5 feet - FILL, SANDY SILTY CLAY: Dry to damp, medium brown, pieces of wood, brick, asphaltic concrete, soft. (CL)

5.5 to 7 feet - BEDROCK, SANDSTONE: Damp, rusty brown, weathered, dense. (SP-SC)

TRENCH 9 - Lot 11

0 to .5 feet - FILL, CLAYEY SILTY SAND WITH GRAVEL: Dry, dark brown, loose. (SM)

.5 to 3 feet - BEDROCK, CLAYEY SAND AND GRAVEL WITH COBBLE TO 6 INCHES: Moist, rusty brown, dense to very dense. (SC)

APPENDIX A

GEOTECHNICAL TRENCH LOGS (CONTINUED)

TRENCH 10 - Lot 10

0 to .5 feet - FILL, CLAYEY SAND AND GRAVEL WITH COBBLE TO 4 INCHES: Dry to damp, rusty brown, pieces of concrete, medium dense. (SC)

.5 to 6.75 feet - ALLUVIUM, CLAYEY SAND WITH GRAVEL: Damp, medium brown, porous, becomes moist with depth, medium dense. (SC)

6.75 to 8 feet - ALLUVIUM, SANDY CLAY: Moist, medium brown, stiff. (CL)

8 to 10 feet - BEDROCK, SANDSTONE: Moist, rusty brown, dense. (SM)

TRENCH 11 - Lot 10

0 to 6.5 feet - FILL, SILTY FINE SAND WITH TRACES OF GRAVEL: Moist, tan, few 6± inch lifts of dark brown clayey sand, medium dense. SM

6.5 to 9 feet - ALLUVIUM, CLAYEY SAND WITH GRAVEL: Moist, medium brown, porous, medium dense. (SC)

9 to 10 feet
8 inches - BEDROCK, SANDSTONE: Moist, rusty brown, dense. (SM)

TRENCH 12 - Lot 10

0 to 2 feet - BEDROCK, SANDSTONE: Damp, rusty brown, dense. (SM)

2 to 2.5 feet - BEDROCK, SANDSTONE: Damp, gray with rust specks. (SW)

TRENCH 13 - Lot 11

0 to 17.5 feet - FILL, CLAYEY SAND WITH GRAVEL, SANDY SILTY CLAY, SILTY SAND ALTERNATING: Dry to damp, mottled browns, piece of brick at 4 feet, dry 8± inch lift at 3 feet 8 inches, moist below 4 feet 6 inches, stiff and dense. SC

TRENCH 14 - Lot 13

0 to 12 feet - FILL, CLAYEY SAND WITH GRAVEL, SANDY SILTY CLAY, SILTY SAND ALTERNATING: Dry to damp, mottled browns, loose from 4 to 5 feet, pieces of concrete and asphaltic concrete at 7 feet. (SC)

APPENDIX A

GEOTECHNICAL TRENCH LOGS (CONTINUED)

TRENCH 14 (Continued)

12 to 13.5 feet - BEDROCK, CLAYEY SAND AND GRAVEL WITH COBBLE TO 6 INCHES: Moist, rusty brown, root hairs, dense to very dense. (SC)

TRENCH 15 - Lot 12

0 to 4.5 feet - FILL, CLAYEY SAND WITH GRAVEL, SANDY SILTY CLAY, SILTY SAND ALTERNATING: Dry to damp, mottled browns, stiff and dense. (SC)

4.5 to 6.5 feet - ALLUVIUM, CLAYEY SILTY SAND WITH GRAVEL: Dry-damp, dark brown, highly porous with root hairs, medium dense. (SM)

6.5 to 8 feet - BEDROCK, SANDSTONE: Moist, rusty brown, porous with root hairs, dense. (SM)

TRENCH 16 - Lot 12

0 to 4 feet - ALLUVIUM, CLAYEY SILTY SAND WITH GRAVEL: Dry, dark brown, highly porous with root hairs, medium dense. (SM)

4 to 9 feet - ALLUVIUM, SANDY SILTY CLAY WITH GRAVEL: Moist, medium brown, highly porous, stiff. (CL)

9 to 10 feet - BEDROCK, SANDSTONE: Very moist, rusty brown, dense. (SM)

TRENCH 17 - Lot 3

0 to 16 inches - ALLUVIUM, CLAYEY SILTY SAND WITH GRAVEL: Dry, dark brown, highly porous with root hairs, dense. (SM)

16 inches to 2.5 feet - ALLUVIUM, CLAYEY SILTY SAND WITH GRAVEL: Damp, medium brown, very dense. (SC)

2.5 to 3 feet - BEDROCK, SANDSTONE: Damp, rusty brown, slightly porous with root hairs, dense. (SM)

APPENDIX C

LABORATORY TEST RESULTS

APPENDIX C - GEOTECHNICAL LABORATORY TESTING

Our geotechnical laboratory testing program was directed toward a quantitative and qualitative evaluation of physical and mechanical properties of soils underlying this campus at proposed improvements, and to aid in verifying soil classification. This geotechnical testing was performed at our Irvine laboratory (DSA LEA 63).

Percentage Passing Sieve No. 200 Sieve (-200): Selected soil samples were wet-wash sieved through a No. 200 U.S. Standard brass sieve in accordance with ASTM Test Methods D 1140 to measure percent fines (silts and clays). This data was used to refine the Unified Soil Classification for tested soil samples. Test results are presented in this appendix and on logs in Appendix B.

Modified Proctor Compaction Curve (MD): Laboratory modified Proctor compaction curves (ASTM D 1557) were established for bulk soil-samples to determine sample-specific modified Proctor laboratory maximum dry density and optimum moisture content. Results of these tests are presented on the following "*Modified Proctor Compaction Test*" sheets in this appendix.

Sieve Analysis (SA): Selected composite soil samples were tested for grain size distribution in accordance with ASTM Test Methods D 6913 to measure grain size. This data was used to refine the Unified Soil Classification for tested soil samples. Test results are presented in this appendix and on logs in Appendix B.

Atterberg Limit Tests: Atterberg Limit tests were performed, in general accordance with ASTM Test Method D 4318, selected soils containing clay material to determine soil compressibility. Following the Dry Preparation Procedure, the soil was dried in an oven at or less than 60° C, pulverized in a mortar and rubber-tipped pestle, and repeatedly sieved using a No. 40 (425-µm) sieve until material retained in the sieve consists of individual grains. The soil that passed through the No. 40 sieve was then placed in a cup and patted with a spatula to a thickness of ~10 mm. A groove was then made in the soil pat from the center to the rim of the of cup and placed in a liquid limit device, where the cup was lifted and dropped until the groove closes (between 25 and 35 drops). The number of drops and moisture content of the soil were then used to determine the soil's liquid limit and plasticity index. Test results are presented in this appendix and on logs in Appendix B.

Swell Potential or Settlement (CO): Selected composite soil samples were tested for wetting-induced swell/collapse strains to develop estimates of heave or settlement of a confined soil profile in accordance with ASTM D 4546. The load-induced strains after

wetting are used to estimate stress-induced settlement following wetting-induced heave or settlement. Test results are presented in this appendix and on logs in Appendix B.

Corrosivity Tests: To evaluate corrosion potential of subsurface soils at the site, we tested a bulk sample collected during our subsurface exploration for pH, electrical resistivity (CTM 643), soluble sulfate content (CTM 417 Part II) and soluble chloride content (CTM 422) testing. Results of these tests are enclosed at the end of this appendix.

R-Value Tests (RV): Selected samples were tested in accordance with DOT CA Test 301. The R-Value test measures the response of a compacted sample of soil or aggregate to a vertically applied pressure under specific conditions. This test is used by Caltrans for pavement design, replacing the California bearing ratio test. The R-value of a material is determined when the material is in a state of saturation such that water will be exuded from the compacted test specimen when a 16.8 kN load (2.07 MPa) is applied to test a series of specimens prepared at different moisture contents. R-Value is used in pavement design, with the thickness of each layer dependent on the R-value of the layer below and the expected level of traffic loading, expressed as a Traffic Index. Results of these tests are enclosed at the end of this appendix.

Expansion Tests (EI): In accordance with ASTM D 4829 the specimen is compacted into a metal ring so that the degree of saturation is between 40 and 60 % and the specimen and the ring are placed in a consolidometer. A vertical confining pressure of 1 psi is applied to the specimen and then the specimen is inundated with distilled water. The deformation of the specimen is recorded for 24 hours or until the rate of deformation becomes less than 0.005 mm/hour. The Expansion Index, EI, is used to measure a basic index property of soil and therefore, the EI is comparable to other indices such as the liquid limit, plastic limit, and plasticity index of soils. Results of these tests are enclosed at the end of this appendix.

Appendix C.1 – Lab Results (current)

TESTS for SULFATE CONTENT
CHLORIDE CONTENT and pH of SOILS

Project Name: 1977 Saturn Street | Tested By : GEB/JD | Date: 12/13/23

Project No. : 19850 | Checked By: J. Ward | Date: 12/29/23

Boring No.	LB-2			
Sample No.	BB-1			
Sample Depth (ft)	0-5			
Soil Identification:	Light yellowish brown (SC)g			
Wet Weight of Soil + Container (g)	0.00			
Dry Weight of Soil + Container (g)	0.00			
Weight of Container (g)	1.00			
Moisture Content (%)	0.00			
Weight of Soaked Soil (g)	100.17			

SULFATE CONTENT, DOT California Test 417, Part II

Beaker No.	402			
Crucible No.	4			
Furnace Temperature (°C)	860			
Time In / Time Out	9:00/9:45			
Duration of Combustion (min)	45			
Wt. of Crucible + Residue (g)	21.6373			
Wt. of Crucible (g)	21.6340			
Wt. of Residue (g) (A)	0.0033			
PPM of Sulfate (A) x 41150	135.79			
PPM of Sulfate, Dry Weight Basis	**136**			

CHLORIDE CONTENT, DOT California Test 422

ml of Extract For Titration (B)	30			
ml of AgNO3 Soln. Used in Titration (C)	0.7			
PPM of Chloride (C -0.2) * 100 * 30 / B	50			
PPM of Chloride, Dry Wt. Basis	**50**			

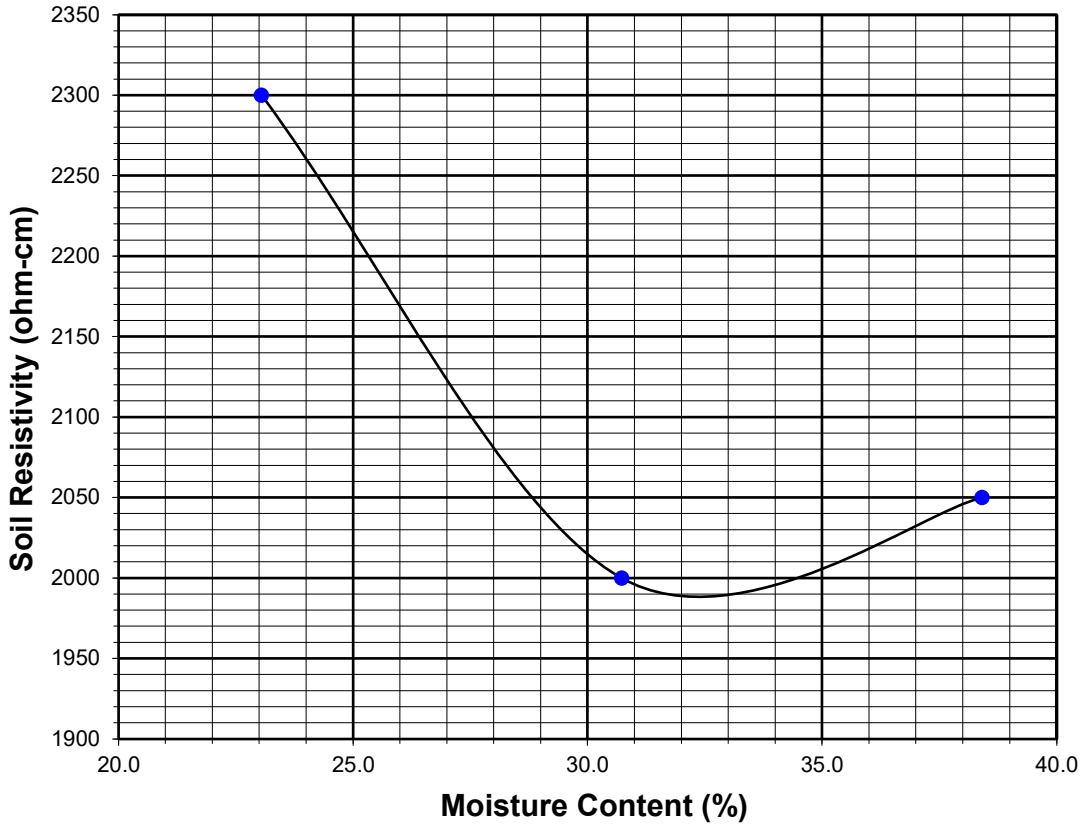
pH TEST, DOT California Test 643

pH Value	**7.81**			
Temperature °C	22.9			

SOIL RESISTIVITY TEST

DOT CA TEST 643

Project Name:	1977 Saturn Street		Tested By :	G. Berdy	Date: 12/13/23
Project No. :	19850		Checked By:	J. Ward	Date: 12/29/23
Boring No.:	LB-2		Depth (ft.) :	0-5	
Sample No. :	BB-1				



Soil Identification:* Light yellowish brown (SC)g

*California Test 643 requires soil specimens to consist only of portions of samples passing through the No. 8 US Standard Sieve before resistivity testing. Therefore, this test method may not be representative for coarser materials.

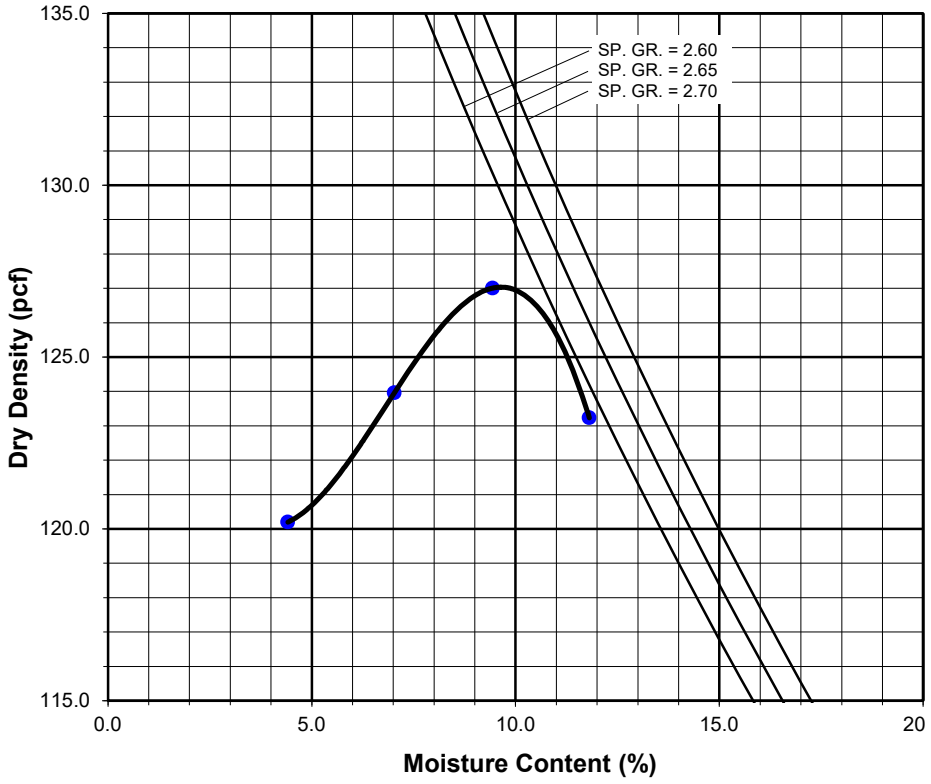
☐ **Procedure A**
Soil Passing No. 4 (4.75 mm) Sieve
Mold : 4 in. (101.6 mm) diameter
Layers : 5 (Five)
Blows per layer : 25 (twenty-five)
May be used if +#4 is 20% or less

☒ **Procedure B**
Soil Passing 3/8 in. (9.5 mm) Sieve
Mold : 4 in. (101.6 mm) diameter
Layers : 5 (Five)
Blows per layer : 25 (twenty-five)
Use if +#4 is >20% and +3/8 in. is 20% or less



☐ **Procedure C**
Soil Passing 3/4 in. (19.0 mm) Sieve
Mold : 6 in. (152.4 mm) diameter
Layers : 5 (Five)
Blows per layer : 56 (fifty-six)
Use if +3/8 in. is >20% and +¾ in. is <30%

Greenhouse Gas Emissions Analysis Memorandum

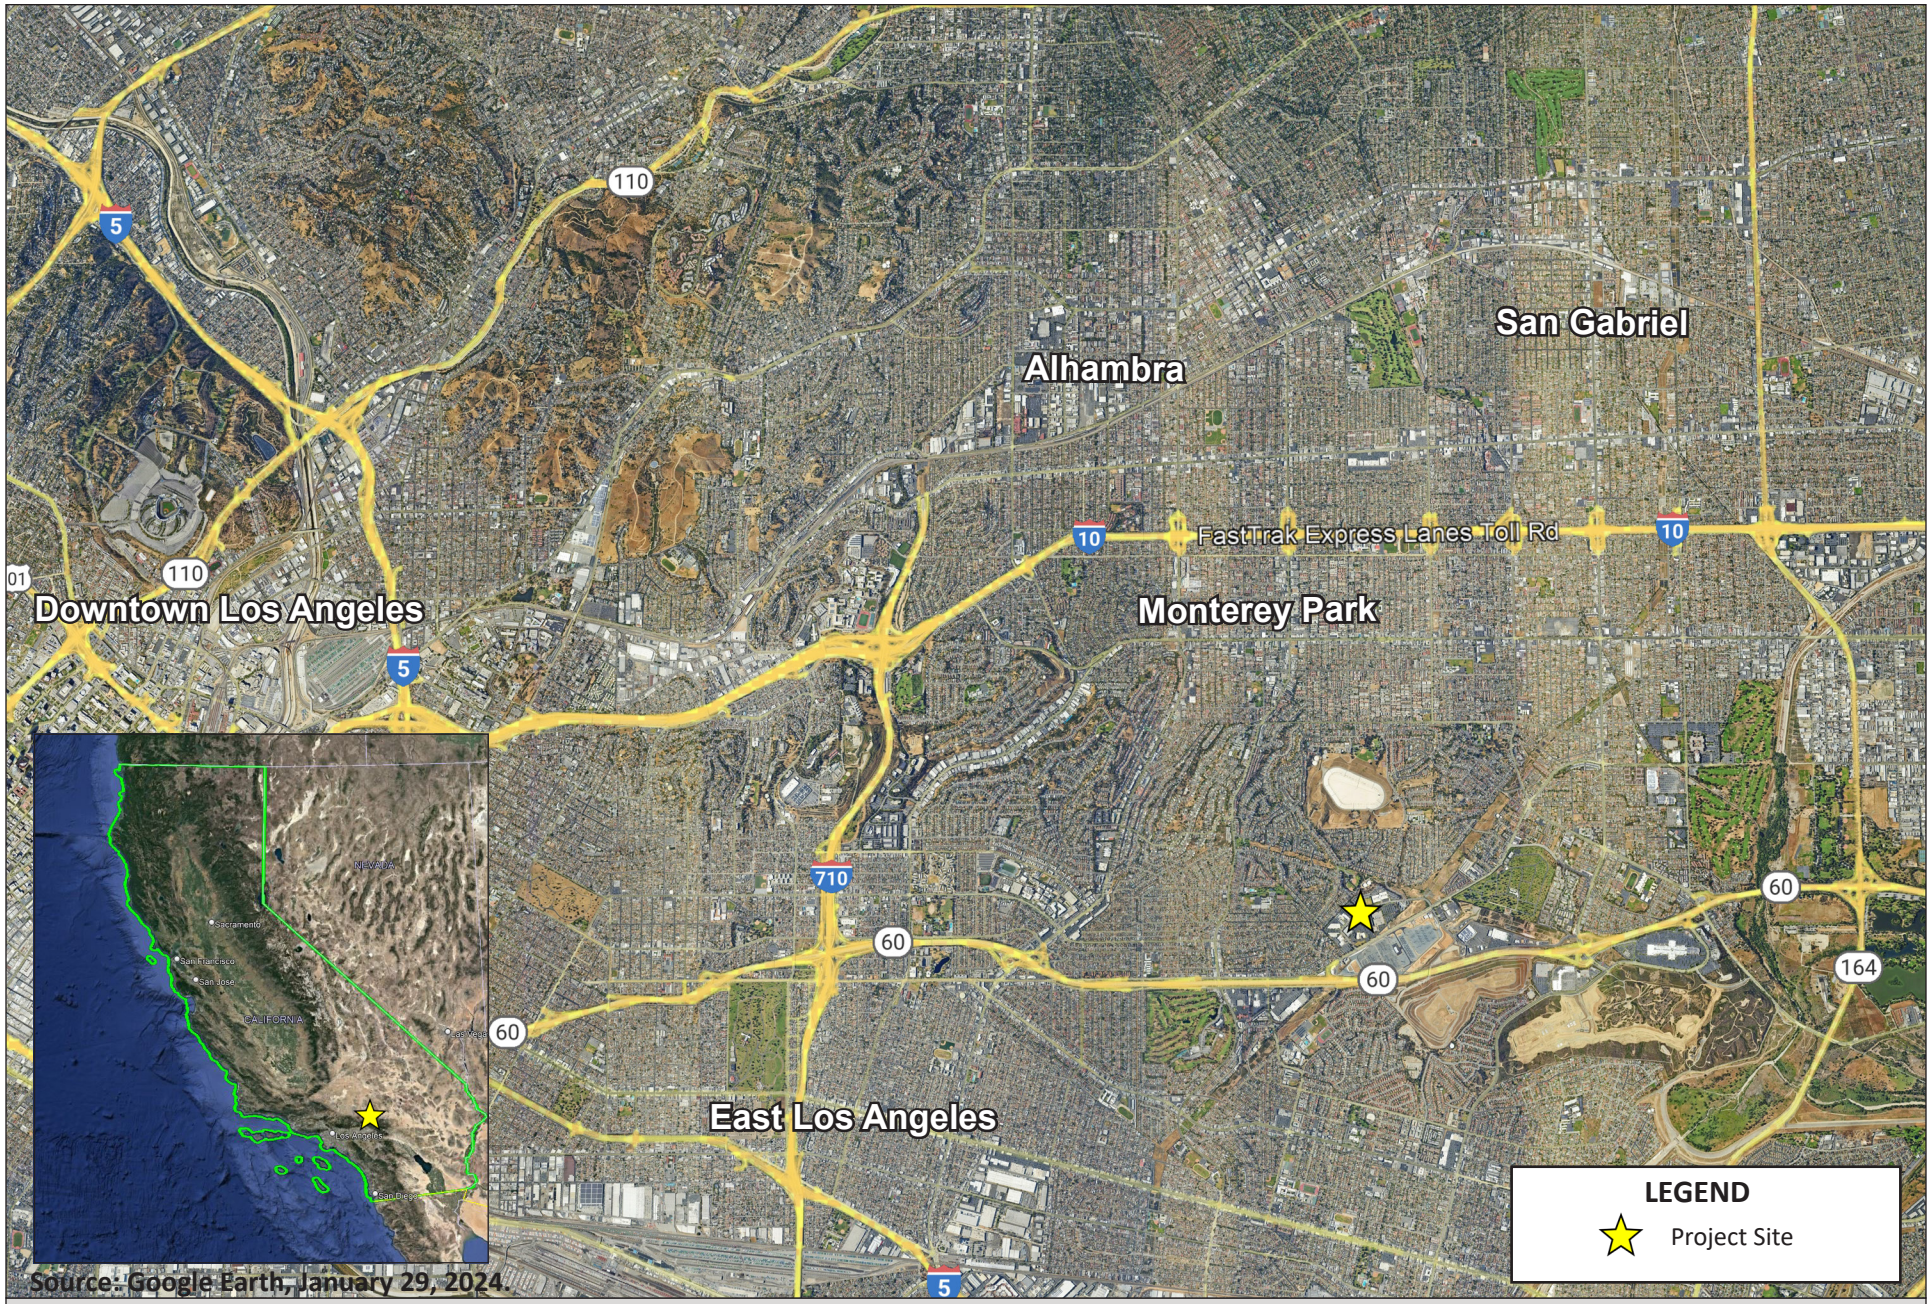
Kimley»Horn

Kimley»Horn

MEMORANDUM

To:	Bryan Marsh, CEO, SDCF Monterey Park, LLC
From:	Heidi Rous, CPP, Kimley-Horn and Associates, Inc. Noemi Wyss, AICP, Kimley-Horn and Associates, Inc.
Date:	August 28, 2024
Subject:	1977 Saturn Data Center Project – Greenhouse Gas Emissions Analysis

1.0 Purpose



The purpose of this memorandum is to assess potential impacts due to greenhouse gas emissions associated with construction and operation of the 1977 Saturn Data Center Project (Project), proposed to be located in the City of Monterey Park (City), California.

2.0 Proposed Project Description

The Project would be located on an approximately 15.8-acre site (Project Site) at 1977 Saturn Street, see **Figure 1: Regional Vicinity Map**. The Project Site is bound by residences, a park, a commercial nursery, and water towers to the north, open space to the east, office uses to the south, and office uses and single-family residences to the west; see **Figure 2: Local Vicinity Map**. The Project Site is currently improved with a two-story commercial office building that is currently vacant, and an ancillary one-story building.

The Project would demolish and remove the existing improvements and construct a state of the art data center including approximately 218,400 square feet that would include approximately 109,970 square feet of data hall space and approximately 91,889 square feet of support space, which would consist of offices and meeting rooms, employee amenities (such as restrooms, break room, etc.), truck loading and unloading areas, storage areas, mechanical/electrical/fiber entry rooms, and other ancillary uses. See **Figure 3: Conceptual Site Plan**. The Project would include a 24,000 square foot electrical substation to be constructed on the northeastern portion of the site. To provide power during an interruption in SCE service, the Applicant would also install 14 diesel emergency generator sets (gen-set). Each gen-set would be capable of producing 4 megawatts (MW) to be used in the event of an emergency.

A total of sixty-eight (68) parking spaces would be provided adjacent to the eastern side of the proposed data center buildings, including three handicapped accessible spaces and three spaces for electrical vehicles (EV). The Project would also include two loading dock areas to accommodate deliveries and loading activities for the proposed data center. Vehicular access to the Project Site would be provided via two new gated driveways located along Saturn Street: one along the western perimeter of the Project Site and the other along the eastern perimeter of the Project Site.

Project construction is anticipated to occur in two phases, lasting approximately two years, beginning as early as September 2025 and ending as early as August 2027. For purposes of this environmental analysis, opening year is assumed to be 2027. Grading for the proposed improvements would require cut and fill to create building pads. Project construction is estimated to require the export of approximately 65,000 cubic yards (cy) of soil.

3.0 Background

Global climate change refers to changes in average climatic conditions on Earth as a whole, including temperature, wind patterns and precipitation. Global temperatures are moderated by naturally occurring atmospheric gases, including water vapor, carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O), as well as hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). These "greenhouse" gases (GHGs) allow solar radiation (sunlight) into the Earth's atmosphere but prevent radiative heat from escaping, thus warming the Earth's atmosphere. GHGs are emitted by both natural processes and human activities. Concentrations of GHG have increased in the atmosphere since the industrial revolution. Human activities that generate GHG emissions include combustion of fossil fuels (CO_2 and N_2O); natural gas generated from landfills, fermentation of manure and cattle farming (CH_4); and industrial processes such as nylon and nitric acid production (N_2O).

GHGs have varying global warming potential (GWP). The GWP is the potential of a gas or aerosol to trap heat in the atmosphere; it is the "cumulative radiative forcing effect of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to a reference gas." The reference gas for GWP is CO_2; therefore, CO_2 has a GWP factor of 1. The other main GHGs that have been attributed to human activity include CH_4, which has a GWP factor of 28, and N_2O, which has a GWP factor of 265. When accounting for GHGs, all types of GHG emissions are expressed in terms of CO_2 equivalents (CO_2e) and are typically quantified in metric tons (MT) or million metric tons (MMT).

4.0 Regulatory Framework

Federal

To date, national standards have not been established for nationwide GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

U.S. Environmental Protection Agency Endangerment Finding

The U.S. Environmental Protection Agency (EPA) authority to regulate GHG emissions stems from the U.S. Supreme Court decision in *Massachusetts v. EPA* (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the U.S. EPA finalized an endangerment finding in December 2009. Based on scientific evidence it found that six GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) constitute a threat to public health and welfare. Thus, it is the Supreme Court's interpretation of the existing FCAA and the U.S. EPA's assessment of the scientific evidence that form the basis for the U.S. EPA's regulatory actions.

Federal Vehicle Standards

In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the U.S. EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the U.S. EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, U.S. EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency.

On April 2, 2018, the Administrator signed the Mid-term Evaluation Final Determination which finds that the model year 2022-2025 GHG standards are not appropriate in light of the record before U.S. EPA and, therefore, should be revised.[1]

On September 19, 2019, under the Safer, Affordable, Fuel-Efficient (SAFE) Vehicles Rule, the U.S. Department of Transportation's National Highway Traffic Safety Administration (NHSTA) and the U.S. EPA issued the final "One National Program Rule." The rule states that federal law preempts state and local laws regarding tailpipe GHG emissions standards, zero emissions vehicle (ZEV) mandates, and fuel economy for automobiles and light duty trucks. The rule revokes California's Clean Air Act waiver and preempts California's Advanced Clean Car Regulations.[2,3]

On September 20, 2019, a lawsuit was filed by California and a coalition of 22 other states, and the cities of Los Angeles, New York and Washington, D.C., in the United States District Court for the District of Columbia (Case 1:19-cv-02826) challenging the SAFE Rule and arguing that U.S. EPA lacks the legal authority to withdraw the California waiver. In April 2021, the U.S. EPA announced it would reconsider its previous withdrawal and grant California permission to set more stringent climate requirements for cars and SUVs. On March 9, 2022, the U.S. EPA restored California's 2013 waiver to full force, including both its GHG standards and ZEV sales requirements.

In December 2021, the U.S. EPA finalized federal GHG emissions standards for passenger cars and light trucks for Model Years 2023 through 2026. These standards are the strongest vehicle emissions standards ever established for the light-duty vehicle sector and are based on sound science and grounded in a rigorous assessment of current and future technologies. The updated standards will result in avoiding more than three billion tons of GHG emissions through 2050.[4]

Presidential Executive Orders 13990 and 14008

On January 20, 2021, President Biden issued Executive Order 13990, "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis". Executive Order 13990 directs Federal agencies to immediately review and take action to address the promulgation of Federal regulations and other actions that conflict with these important national objectives and to

4 U.S. EPA, Final Rule to Revise Existing National GHG Emissions Standards for Passenger Cars and Light Trucks Through Model Year 2026, 2021, https://www.epa.gov/regulations-emissions-vehicles-and-engines/final-rule-revise-existing-national-ghg-emissions. Accessed March 18, 2024.

immediately commence work to confront the climate crisis. Executive Order 13990 directs the Council on Environmental Quality (CEQ) to review CEQ's 2020 regulations implementing the procedural requirements of the National Environmental Policy Act (NEPA) and identify necessary changes or actions to meet the objectives of Executive Order 13990.

Executive Order 13390 also directs the U.S. EPA to consider whether to propose suspending, revising, or rescinding the standards previously revised under the "The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks," promulgated in April 2020.

On January 27, 2021, President Biden signed Executive Order 14008, "Tackling the Climate Crisis at Home and Abroad," to declare the Administration's policy to move quickly to build resilience, both at home and abroad, against the impacts of climate change that are already manifest and will continue to intensify according to current trajectories. In line with these Executive Order directives, CEQ is reviewing the 2020 NEPA regulations and plans to publish a notice of proposed rulemaking (NPRM) to identify necessary revisions in order to comply with the law; meet the environmental, climate change, and environmental justice objectives of Executive Orders 13990 and 14008; ensure full and fair public involvement in the NEPA process; provide regulatory certainty to stakeholders; and promote better decision making consistent with NEPA's statutory requirements. This phase 1 rulemaking will propose a narrow set of changes to the 2020 NEPA regulations to address these goals.

State

California Air Resources Board

The California Air Resources Board (CARB) is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California's contribution to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of CO_2 equivalents (CO_2e) in the world and produced 369 million gross metric tons of CO_2e in 2020.[5] In the State, the transportation sector is the largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark Assembly Bill (AB) 32, *California Global Warming Solutions Act of 2006*, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance

[5] California Air Resources Board, Current California GHG Emissions Inventory Data, 2000-2020 GHG inventory (2022 Edition), https://ww2.arb.ca.gov/ghg-inventory-data. Accessed March 18, 2024.

energy standards, were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major provisions of the legislation.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

AB 32 instructs the CARB to develop and enforce regulations for the reporting and verification of statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020, which would require a reduction of approximately 173 MMT net CO_2e below "business as usual" emission levels. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

Climate Change Scoping Plan

The Scoping Plan is a GHG emission reduction roadmap developed and updated by the CARB at least once every five years, as required by AB 32. It lays out the transformations needed across various sectors to reduce GHG emissions and reach the State's climate targets. CARB published the Final 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan Update) in November 2022, as the third update to the initial plan that was adopted in 2008. The initial 2008 Scoping Plan laid out a path to achieve the AB 32 target of returning to 1990 levels of GHG emissions by 2020, a reduction of approximately 15 percent below business as usual activities.[6] The 2008 Scoping Plan included a mix of incentives, regulations, and carbon pricing, laying out the portfolio approach to addressing climate change and clearly making the case for using multiple tools to meet California's GHG targets. The 2013 Scoping Plan Update (adopted in 2014) assessed progress toward achieving the 2020 target and made the case for addressing short-lived climate pollutants (SLCPs).[7] The 2017 Scoping Plan Update,[8] shifted focus to the newer Senate Bill (SB) 32 goal of a 40 percent reduction below 1990 levels by 2030 by laying out a detailed cost-effective and technologically feasible path to this target, and also assessed progress towards achieving the AB 32 goal of returning to 1990 GHG levels by 2020. The 2020 goal was ultimately reached in 2016, four years ahead of the schedule called for under AB 32.

The 2022 Scoping Plan Update is the most comprehensive and far-reaching Scoping Plan developed to date. It identifies a technologically feasible, cost-effective, and equity-focused path to achieve new targets for carbon neutrality by 2045 and to reduce anthropogenic GHG emissions to at least 85 percent below 1990 levels, while also assessing the progress California is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in

[6] CARB, Climate Change Scoping Plan, 2008, ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/document/adopted_scoping_plan.pdf. Accessed April 22, 2024.

[7] CARB, First Update to the Climate Change Scoping Plan, 2014, ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf. Accessed April 22, 2024.

the 2017 Scoping Plan. According to the Scoping Plan Update, the 2030 target is an interim but important stepping stone along the critical path to the broader goal of deep decarbonization by 2045. The relatively longer path assessed in the 2022 Scoping Plan Update incorporates, coordinates, and leverages many existing and ongoing efforts to reduce GHGs and air pollution, while identifying new clean technologies and energy. Given the focus on carbon neutrality, the 2022 Scoping Plan Update also includes discussion for the first time of the natural and working lands sectors as sources for both sequestration and carbon storage, and as sources of emissions as a result of wildfires. **Table 1: Statewide Greenhouse Gas Emission Projections** shows the GHG emissions associated with various emissions scenarios.

Table 1: Statewide Greenhouse Gas Emission Projections

Emissions Scenario as Presented in the 2022 Scoping Plan Update	GHG Emissions ($MMTCO_2e$ per year)
2019	
2019 State GHG Emissions	404
2030	
2030 BAU Forecast	312
2030 GHG Emissions without Carbon Removal and Capture	233
2030 GHG Emissions with Carbon Removal and Capture	226
2030 Emissions Target Set by AB 32 (i.e., 1990 level by 2030)	260
Reduction below Business-As-Usual necessary to achieve 1990 levels by 2030	52 (16.7%)[1]
2045	
2045 BAU Forecast	266
2045 GHG Emissions without Carbon Removal and Capture	72
2045 GHG Emissions with Carbon Removal and Capture	(3)

$MMTCO_2e$ = million metric tons of carbon dioxide equivalents; parenthetical numbers represent negative values.
1. (312 – 260) / 312 = 16.7%
Source: CARB, Final 2022 Climate Change Scoping Plan, November 2022.

The 2022 Scoping Plan Update reflects existing and recent direction in the Governor's Executive Orders and State Statutes, which identify policies, strategies, and regulations in support of and implementation of the Scoping Plan. Among these include Executive Order B-55-18 and AB 1279 (The California Climate Crisis Act), which identify the 2045 carbon neutrality and GHG reduction targets required for the Scoping Plan.

Table 2: Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan provides a summary of major climate legislation and executive orders issued since the adoption of the 2017 Scoping Plan.

Table 2: Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan	
Bill/Executive Order	**Summary**
Assembly Bill 1279 (AB 1279) (Muratsuchi, Chapter 337, Statutes of 2022) *The California Climate Crisis Act*	AB 1279 establishes the policy of the state to achieve carbon neutrality as soon as possible, but no later than 2045; to maintain net negative GHG emissions thereafter; and to ensure that by 2045 statewide anthropogenic GHG emissions are reduced at least 85 percent below 1990 levels. The bill requires CARB to ensure that the Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal solutions and carbon capture, utilization, and storage (CCUS) technologies. This bill is reflected directly in the 2022 Scoping Plan Update.
Senate Bill 905 (SB 905) (Caballero, Chapter 359, Statutes of 2022) *Carbon Capture, Removal, Utilization, and Storage Program*	SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate CCUS and carbon dioxide removal (CDR) projects and technology. The bill requires CARB, on or before January 1, 2025, to adopt regulations creating a unified state permitting application for approval of CCUS and CDR projects. The bill also requires the Secretary of the Natural Resources Agency to publish a framework for governing agreements for two or more tracts of land overlying the same geologic storage reservoir for the purposes of a carbon sequestration project. The 2022 Scoping Plan Update modeling reflects both CCUS and CDR contributions to achieve carbon neutrality.
Senate Bill 846 (SB 846) (Dodd, Chapter 239, Statutes of 2022) *Diablo Canyon Powerplant: Extension of Operations*	SB 846 extends the Diablo Canyon Power Plant's sunset date by up to five additional years for each of its two units and seeks to make the nuclear power plant eligible for federal loans. The bill requires that the California Public Utilities Commission (CPUC) not include and disallow a load-serving entity from including in their adopted resource plan, the energy, capacity, or any attribute from the Diablo Canyon power plant. The 2022 Scoping Plan Update explains the emissions impact of this legislation.
Senate Bill 1020 (SB 1020) (Laird, Chapter 361, Statutes of 2022) *Clean Energy, Jobs, and Affordability Act of 2022*	SB 1020 adds interim renewable energy and zero carbon energy retail sales of electricity targets to California end-use customers set at 90 percent in 2035 and 95 percent in 2040. It accelerates the timeline required to have 100 percent renewable energy and zero carbon energy procured to serve state agencies from the original target year of 2045 to 2035. This bill requires each state agency to individually achieve the 100 percent goal by 2035 with specified

Table 2: Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan	
Bill/Executive Order	**Summary**
	requirements. This bill requires the CPUC, California Energy Commission (CEC), and CARB, on or before December 1, 2023, and annually thereafter, to issue a joint reliability progress report that reviews system and local reliability. The bill also modifies the requirement for CARB to hold a portion of its Scoping Plan workshops in regions of the state with the most significant exposure to air pollutants by further specifying that this includes communities with minority populations or low-income communities in areas designated as being in extreme federal non-attainment. The 2022 Scoping Plan Update describes the implications of this legislation on emissions.
Senate Bill 1137 (SB 1137) (Gonzales, Chapter 365, Statutes of 2022) *Oil & Gas Operations: Location Restrictions: Notice of Intention: Health protection zone: Sensitive receptors*	SB 1137 prohibits the development of new oil and gas wells or infrastructure in health protection zones, as defined, except for purposes of public health and safety or other limited exceptions. The bill requires operators of existing oil and gas wells or infrastructure within health protection zones to undertake specified monitoring, public notice, and nuisance requirements. The bill requires CARB to consult and concur with the California Geologic Energy Management Division (CalGEM) on leak detection and repair plans for these facilities, adopt regulations as necessary to implement emission detection system standards, and collaborate with CalGEM on public access to emissions detection data.
Senate Bill 1075 (SB 1075) (Skinner, Chapter 363, Statutes of 2022) *Hydrogen: Green Hydrogen: Emissions of Greenhouse Gases*	SB 1075 requires CARB, by June 1, 2024, to prepare an evaluation that includes: policy recommendations regarding the use of hydrogen, and specifically the use of green hydrogen, in California; a description of strategies supporting hydrogen infrastructure, including identifying policies that promote the reduction of GHGs and short-lived climate pollutants; a description of other forms of hydrogen to achieve emission reductions; an analysis of curtailed electricity; an estimate of GHG and emission reductions that could be achieved through deployment of green hydrogen through a variety of scenarios; an analysis of the potential for opportunities to integrate hydrogen production and applications with drinking water supply treatment needs; policy recommendations for regulatory and permitting processes associated with transmitting and distributing hydrogen from production sites to end uses; an analysis of the life-cycle GHG emissions from various forms of hydrogen production; and an analysis of air pollution and other environmental impacts from hydrogen distribution and end uses.

Table 2: Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan	
Bill/Executive Order	**Summary**
	This bill informs the production of hydrogen at the scale called for in the 2022 Scoping Plan Update.
Assembly Bill 1757 (AB 1757) (Garcia, Chapter 341, Statutes of 2022) *California Global Warming Solutions Act of 2006: Climate Goal: Natural and Working Lands*	AB 1757 requires the California Natural Resources Agency (CNRA), in collaboration with CARB, other state agencies, and an expert advisory committee, to determine a range of targets for natural carbon sequestration, and for nature-based climate solutions, that reduce GHG emissions in 2030, 2038, and 2045 by January 1, 2024. These targets must support state goals to achieve carbon neutrality and foster climate adaptation and resilience. This bill also requires CARB to develop standard methods for state agencies to consistently track GHG emissions and reductions, carbon sequestration, and additional benefits from natural and working lands over time. These methods will account for GHG emissions reductions of CO2, methane, and nitrous oxide related to natural and working lands and the potential impacts of climate change on the ability to reduce GHG emissions and sequester carbon from natural and working lands, where feasible. This 2022 Scoping Plan Update describes the next steps and implications of this legislation for the natural and working lands sector.
Senate Bill 1206 (SB 1206) (Skinner, Chapter 884, Statutes of 2022) *Hydrofluorocarbon gases: sale or distribution*	SB 1206 mandates a stepped sales prohibition on newly produced high- global warming potential (GWP) HFCs to transition California's economy toward recycled and reclaimed HFCs for servicing existing HFC-based equipment. Additionally, SB 1206 also requires CARB to develop regulations to increase the adoption of very low-, i.e., GWP < 10, and no-GWP technologies in sectors that currently rely on higher-GWP HFCs.
Senate Bill 27 (SB 27) (Skinner, Chapter 237, Statutes of 2021) *Carbon Sequestration: State Goals: Natural and Working Lands: Registry of Projects*	SB 27 requires CNRA, in coordination with other state agencies, to establish the Natural and Working Lands Climate Smart Strategy by July 1, 2023. This bill also requires CARB to establish specified CO2 removal targets for 2030 and beyond as part of its Scoping Plan. Under SB 27, CNRA is to establish and maintain a registry to identify projects in the state that drive climate action on natural and working lands and are seeking funding. CNRA also must track carbon removal and GHG emission reduction benefits derived from projects funded through the registry. This bill is reflected directly in the 2022 Scoping Plan Update as CO_2 removal targets for 2030 and 2045 in support of carbon neutrality.

Table 2: Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan	
Bill/Executive Order	**Summary**
Executive Order N-82-20	Governor Newsom signed Executive Order N-82-20 in October 2020 to combat the climate and biodiversity crises by setting a statewide goal to conserve at least 30 percent of California's land and coastal waters by 2030. The Executive Order also instructed the CNRA, in consultation with other state agencies, to develop a Natural and Working Lands Climate Smart Strategy that serves as a framework to advance the state's carbon neutrality goal and build climate resilience. In addition to setting a statewide conservation goal, the Executive Order directed CARB to update the target for natural and working lands in support of carbon neutrality as part of this Scoping Plan, and to take into consideration the NWL Climate Smart Strategy. CO2 Executive Order N-82-20 also calls on the CNRA, in consultation with other state agencies, to establish the California Biodiversity Collaborative (Collaborative). The Collaborative shall be made up of governmental partners, California Native American tribes, experts, business and community leaders, and other stakeholders from across the state. State agencies will consult the Collaborative on efforts to: • Establish a baseline assessment of California's biodiversity that builds upon existing data and can be updated over time. • Analyze and project the impact of climate change and other stressors in California's biodiversity. • Inventory current biodiversity efforts across all sectors and highlight opportunities for additional action to preserve and enhance biodiversity. CNRA also is tasked with advancing efforts to conserve biodiversity through various actions, such as streamlining the state's process to approve and facilitate projects related to environmental restoration and land management. The California Department of Food and Agriculture (CDFA) is directed to advance efforts to conserve biodiversity through measures such as reinvigorating populations of pollinator insects, which restore biodiversity and improve agricultural production. The Natural and Working Lands Climate Smart Strategy informs the 2022 Scoping Plan Update.
Executive Order N-79-20	Governor Newsom signed Executive Order N-79-20 in September 2020 to establish targets for the transportation sector to support the state in its goal to achieve carbon neutrality by 2045. The targets established in this Executive Order are:

Table 2: Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan	
Bill/Executive Order	**Summary**
	• 100 percent of in-state sales of new passenger cars and trucks will be zero-emission by 2035. • 100 percent of medium- and heavy-duty vehicles will be zero-emission by 2045 for all operations where feasible, and by 2035 for drayage trucks. • 100 percent of off-road vehicles and equipment will be zero-emission by 2035 where feasible. The Executive Order also tasked CARB to develop and propose regulations that require increasing volumes of zero- electric passenger vehicles, medium- and heavy-duty vehicles, drayage trucks, and off-road vehicles toward their corresponding targets of 100 percent zero-emission by 2035 or 2045, as listed above. The 2022 Scoping Plan Update modeling reflects achieving these targets.
Executive Order N-19-19	Governor Newsom signed Executive Order N-19-19 in September 2019 to direct state government to redouble its efforts to reduce GHG emissions and mitigate the impacts of climate change while building a sustainable, inclusive economy. This Executive Order instructs the Department of Finance to create a Climate Investment Framework that: • Includes a proactive strategy for the state's pension funds that reflects the increased risks to the economy and physical environment due to climate change. • Provides a timeline and criteria to shift investments to companies and industry sectors with greater growth potential based on their focus of reducing carbon emissions and adapting to the impacts of climate change. • Aligns with the fiduciary responsibilities of the California Public Employees' Retirement System, California State Teachers' Retirement System, and the University of California Retirement Program. Executive Order N-19-19 directs the State Transportation Agency to leverage more than $5 billion in annual state transportation spending to help reverse the trend of increased fuel consumption and reduce GHG emissions associated with the transportation sector. It also calls on the Department of General Services to leverage its management and ownership of the state's 19 million square feet in managed buildings, 51,000 vehicles, and other physical assets and goods to minimize state government's carbon footprint. Finally, it tasks CARB

Table 2: Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan	
Bill/Executive Order	**Summary**
	with accelerating progress toward California's goal of five million ZEV sales by 2030 by: • Developing new criteria for clean vehicle incentive programs to encourage manufacturers to produce clean, affordable cars. • Proposing new strategies to increase demand in the primary and secondary markets for ZEVs. • Considering strengthening existing regulations or adopting new ones to achieve the necessary GHG reductions from within the transportation sector. The 2022 Scoping Plan Update modeling reflects efforts to accelerate ZEV deployment.
Assembly Bill 65 (AB 65) (Petrie-Norris, Chapter 347, Statutes of 2019) *Coastal Protection: Climate Adaption: Project Prioritization: Natural Infrastructure: Local General Plans*	This bill requires the State Coastal Conservancy, when it allocates any funding appropriated pursuant to the California Drought, Water, Parks, Climate, Coastal Protection, and Outdoor Access For All Act of 2018, to prioritize projects that use natural infrastructure in coastal communities to help adapt to climate change. The bill requires the conservancy to provide information to the Office of Planning and Research on any projects funded pursuant to the above provision to be considered for inclusion into the clearinghouse for climate adaptation information. The bill authorizes the conservancy to provide technical assistance to coastal communities to better assist them with their projects that use natural infrastructure.
Executive Order B-55-18	Governor Brown signed Executive Order B-55-18 in September 2018 to establish a statewide goal to achieve carbon neutrality as soon as possible, and no later than 2045, and to achieve and maintain net negative emissions thereafter. Policies and programs undertaken to achieve this goal shall: • Seek to improve air quality and support the health and economic resiliency of urban and rural communities, particularly low-income and disadvantaged communities. • Be implemented in a manner that supports climate adaptation and biodiversity, including protection of the state's water supply, water quality, and native plants and animals. This Executive Order also calls for CARB to: • Develop a framework for implementation and accounting that tracks progress toward this goal.

Table 2: Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan	
Bill/Executive Order	**Summary**
	• Ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal. The 2022 Scoping Plan Update is designed to achieve carbon neutrality no later than 2045 and the modeling includes technology and fuel transitions to achieve that outcome.
Senate Bill 100 (SB 100) (De León, Chapter 312, Statutes of 2018) *California Renewables Portfolio Standard Program: emissions of greenhouse gases*	Under SB 100, the CPUC, CEC, and CARB shall use programs under existing laws to achieve 100 percent clean electricity. The statute requires these agencies to issue a joint policy report on SB 100 every four years. The first of these reports was issued in 2021. The 2022 Scoping Plan Update reflects the SB 100 Core Scenario resource mix with a few minor updates.
Assembly Bill 2127 (AB 2127) (Ting, Chapter 365, Statutes of 2018) *Electric Vehicle Charging Infrastructure: Assessment*	This bill requires the CEC, working with CARB and the CPUC, to prepare and biennially update a statewide assessment of the electric vehicle charging infrastructure needed to support the levels of electric vehicle adoption required for the state to meet its goals of putting at least 5 million zero-emission vehicles on California roads by 2030 and of reducing emissions of GHGs to 40 percent below 1990 levels by 2030. The bill requires the CEC to regularly seek data and input from stakeholders relating to electric vehicle charging infrastructure. This bill supports the deployment of ZEVs as modeled in the 2022 Scoping Plan Update.
Senate Bill 30 (SB 30) (Lara, Chapter 614, Statutes of 2018) *Insurance: Climate Change*	This bill requires the Insurance Commissioner to convene a working group to identify, assess, and recommend risk transfer market mechanisms that, among other things, promote investment in natural infrastructure to reduce the risks of climate change related to catastrophic events, create incentives for investment in natural infrastructure to reduce risks to communities, and provide mitigation incentives for private investment in natural lands to lessen exposure and reduce climate risks to public safety, property, utilities, and infrastructure. The bill requires the policies recommended to address specified questions.

Table 2: Major Climate Legislation and Executive Orders Enacted Since the 2017 Scoping Plan	
Bill/Executive Order	**Summary**
Assembly Bill 2061 (AB 2061) (Frazier, Chapter 580, Statutes of 2018) *Near-zero-emission and Zero-emission Vehicles*	Existing state and federal laws set specified limits on the total gross weight imposed on the highway by a vehicle with any group of two or more consecutive axles. Under existing federal law, the maximum gross vehicle weight of that vehicle may not exceed 82,000 pounds. AB 2061 authorizes a near-zero- emission vehicle or a zero-emission vehicle to exceed the weight limits on the power unit by up to 2,000 pounds. This bill supports the deployment of cleaner trucks as modeled in this 2022 Scoping Plan Update.

The 2022 Scoping Plan Update scenario identifies the need to accelerate AB 32's 2030 target, from 40 percent to 48 percent below 1990 levels. Cap-and-Trade regulation continues to play a large factor in the reduction of near-term emissions for meeting the 2030 reduction target. Every sector of the economy will need to begin to transition in this decade to meet these GHG reduction goals and achieve carbon neutrality no later than 2045. The 2022 Scoping Plan Update approaches decarbonization from two perspectives, managing a phasedown of existing energy sources and technologies, as well as increasing, developing, and deploying alternative clean energy sources and technology. The Scoping Plan Scenario is summarized in Table 2-1 starting on page 72 of the Scoping Plan. It includes references to relevant statutes and Executive Orders, although it is not comprehensive of all existing new authorities for directing or supporting the actions described. Table 2-1 identifies actions related to a variety of sectors such as: smart growth and reductions in Vehicle Miles Traveled (VMT); light-duty vehicles (LDV) and zero-emission vehicles (ZEV); truck ZEVs; reduce fossil energy, emissions, and GHGs for aviation ocean-going vessels, port operations, freight and passenger rail, oil and gas extraction; and petroleum refining; improvements in electricity generation; electrical appliances in new and existing residential and commercial buildings; electrification and emission reductions across industries such as the for food products, construction equipment, chemicals and allied products, pulp and paper, stone/clay/glass/cement, other industrial manufacturing, and agriculture; retiring of combined heat and power facilities; low carbon fuels for transportation, business, and industry; improvements in non-combustion methane emissions, and introduction of low GWP refrigerants.

Achieving the targets described in the 2022 Scoping Plan Update will require continued commitment to and successful implementation of existing policies and programs, and identification of new policy tools and technical solutions to go further, faster. California's Legislature and state agencies will continue to collaborate to achieve the state's climate, clean air, equity, and broader economic and environmental protection goals. It will be necessary to maintain and strengthen this collaborative

effort, and to draw upon the assistance of the federal government, regional and local governments, tribes, communities, academic institutions, and the private sector to achieve the state's near-term and longer-term emission reduction goals and a more equitable future for all Californians. The Scoping Plan acknowledges that the path forward is not dependent on one agency, one state, or even one country. However, the State can lead by engaging Californians and demonstrating how actions at the state, regional, and local levels of governments, as well as action at community and individual levels, can contribute to addressing the challenge.

Aligning local jurisdiction action with state-level priorities to tackle climate change and the outcomes called for in the 2022 Scoping Plan Update is identified as critical to achieving the statutory targets for 2030 and 2045. The 2022 Scoping Plan Update discusses the role of local governments in meeting the State's GHG reductions goals. Local governments have the primary authority to plan, zone, approve, and permit how and where land is developed to accommodate population growth, economic growth, and the changing needs of their jurisdictions. They also make critical decisions on how and when to deploy transportation infrastructure, and can choose to support transit, walking, bicycling, and neighborhoods that do not force people into cars. Local governments also have the option to adopt building ordinances that exceed statewide building code requirements and play a critical role in facilitating the rollout of ZEV infrastructure. As a result, local government decisions play a critical role in supporting state-level measures to contain the growth of GHG emissions associated with the transportation system and the built environment—the two largest GHG emissions sectors over which local governments have authority. The City has taken the initiative in combating climate change by developing programs and regulations such as the Green New Deal and Green Building Code. Each of these is discussed further below.

California Regulations and Building Codes

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

Title 20 Appliance Efficiency Regulations. The appliance efficiency regulations (California Code of Regulations [CCR] Title 20, Sections 1601-1608) include standards for new appliances. Twenty-three categories of appliances are included in the scope of these regulations. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

Title 24 Building Energy Efficiency Standards. California's Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6) was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. Energy

efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The 2016 Building Energy Efficiency Standards approved on January 19, 2016, went into effect on January 1, 2017. The 2019 Building Energy Efficiency Standards were adopted on May 9, 2018, and went into effect on January 1, 2020. Under the 2019 standards, homes will use about 53 percent less energy and nonresidential buildings will use about 30 percent less energy than buildings under the 2016 standards.

On August 11, 2021, the CEC adopted the 2022 Building Energy Efficiency Standards (2022 Energy Code). In December, it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Energy Code encourages efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, strengthens ventilation standards, and more. Buildings whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.[9]

Title 24 California Green Building Standards Code. The California Green Building Standards Code (CCR Title 24, Part 11 code) commonly referred to as the CALGreen Code, is a statewide mandatory construction code developed and adopted by the California Building Standards Commission and the Department of Housing and Community Development. The CALGreen standards require new residential and commercial buildings to comply with mandatory measures under the topics of planning and design, energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt that encourage or require additional measures in the five green building topics. The most recent update to the CALGreen Code went into effect January 1, 2023 (2022 CALGreen). The 2022 CALGreen standards continue to improve upon the existing standards for new construction of, and additions and alterations to, residential and nonresidential buildings.

Regional

South Coast Air Quality Management District Thresholds

The SCAQMD is the air pollution control agency for Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino Counties. The agency's primary responsibility is ensuring that California Ambient Air Quality Standards (CAAQS) and National Ambient Air Quality Standards (NAAQS) are attained and maintained in the South Coast Air Basin. The SCAQMD is also responsible for adopting and enforcing rules and regulations concerning air pollutant sources, issuing permits for stationary sources of air pollutants, inspecting stationary sources of air pollutants, responding to citizen complaints, monitoring ambient air quality and meteorological conditions, awarding grants to

[9] California Energy Commission, 2022 Building Energy Efficiency Standards, https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency. Accessed March 9, 2024.

reduce motor vehicle emissions, conducting public education campaigns, and many other activities. All projects are subject to applicable SCAQMD rules and regulations in effect at the time of construction and operation. The following is the SCAQMD rule relevant to GHG:

- **Rule 1415 (Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems)** – The purpose of this rule is to reduce emissions of high-global warming potential refrigerants from stationary air conditioning systems by requiring projects to reclaim, recover, or recycle refrigerant and minimize leakage.

Southern California Association of Governments

On September 3, 2020, SCAG's Regional Council adopted Connect SoCal (2020 - 2045 Regional Transportation Plan/Sustainable Communities Strategy [2020 RTP/SCS]). The RTP/SCS charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The strategy was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses, and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The RTP/SCS is a long-range vision plan that balances future mobility and housing needs with economic, environmental, and public health goals. The SCAG region strives toward sustainability through integrated land use and transportation planning. The SCAG region must achieve specific federal air quality standards and is required by state law to lower regional GHG emissions.

Local

City of Monterey Park General Plan

The City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City's General Plan includes a Sustainable Community Element, adopted in 2014, that contains the following policies specific to greenhouse gas emissions applicable to the Project:

Sustainability Community Element

Goal 9: Greenhouse gas emissions from energy production are minimized through reduced energy demand and expanded use of renewable energy sources.

Policy 9.1 Increased Energy Efficiency: Ensure high energy efficiency for all buildings through demonstration, education, and incentives.

Policy 9.3 Solar-Ready Roofs: For new construction and renovations, encourage builders to provide roofs that are solar panel-ready particularly commercial roofs.

City of Monterey Park Climate Action Plan (CAP)

The City's qualified Climate Action Plan (CAP), approved in 2012, provides the City's road map to reducing community GHG emissions associated with existing and future actions and activities. The CAP was adopted by the City Council on October 3, 2012. The CAP included baseline emissions inventory and projection of future emissions; establishing a community-wide reduction target for 2020 and 2035; identify strategies, actions, and measures to meet reduction targets; evaluate CEQA impacts of the proposed strategies; and monitor effectiveness of reduction measures and the CAP to changing conditions. The CAP establishes a policy to reduce the City's GHG emissions by 15 percent below baseline 2009 levels by 2020, and sets an aspirational goal of achieving GHG emissions 49 percent below baseline 2009 levels by 2035. The CAP does not include quantitative project-level CEQA thresholds or percentage reduction targets for individual projects.

The CAP includes numerous GHG reduction measures, split into five categories: Energy, Land Use, Transportation, Water, and State and Federal. The State and Federal measures would account for 67.9 percent reduction in GHG emissions. The remaining four categories are considered City measures. The complete list of GHG reduction measures is shared in Threshold (b) below. Generally, the purpose of the CAP is to establish measures capable of reducing GHG and promoting economic growth based on clean technology and sustainable practices.

5.0 Significance Criteria and Methodology

5.1 Thresholds of Significance Criteria

Addressing GHG emissions generation impacts requires an agency to determine what constitutes a significant impact. The CEQA Guidelines allow lead agencies to determine the thresholds of significance based to the extent possible on scientific and factual data that illustrate the extent of an impact. This means that each agency may determine whether to: (1) quantify greenhouse gas emissions resulting from a project; and/or (2) rely on a qualitative analysis or performance-based standard. CEQA Guidelines Section 15064.4(a) directs that agencies are to use "careful judgment" and "make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" the Project's GHG emissions.

Appendix G of the CEQA Guidelines sets forth two general thresholds that state whether the project would:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

As discussed above, no applicable numeric significance threshold for GHG emissions has been adopted by the State, SCAQMD, or the City that applies to the proposed Project. Further, although State, regional, and local plans and policies have been adopted to help address climate change (see discussions above), no current law or regulation would regulate all aspects of the Project's GHG emissions. In the absence of any adopted numeric threshold, the City has determined that the significance of the Project's GHG emissions as provided in CEQA Guidelines Section 15064.4(b)(2) will be assessed by determining whether the Project is consistent with applicable plans, policies, regulations adopted for the purpose of reducing the emissions of greenhouse gases.

Therefore, under this analysis, a significant impact would occur if the Project would conflict with applicable regulatory plans and policies of the lead agency (i.e., the City of Monterey Park) to reduce GHG emissions discussed within the City's CAP. The analysis below describes the extent to which the Project complies with the regulations outlined in the CAP.

Notwithstanding the above, for informational purposes, the analysis also calculates the amount of GHG emissions that would be attributable to the Project using air quality models. The primary purpose of quantifying the Project GHG emissions is to satisfy CEQA Guidelines Section 15064.4(a), which calls for a good-faith effort to describe and calculate emissions. The estimated emissions inventory is also used to determine if there would be a reduction in the Project's incremental contribution of GHG emissions as a result of compliance with regulations and requirements adopted to implement plans for the reduction or mitigation of GHG emissions. However, the significance of the Project's GHG emissions impacts is not based on the amount of GHG emissions resulting from the Project.

5.2 Methodology

The Project's construction and operational emissions were calculated using the California Emissions Estimator Model version 2022.1.1.21 (CalEEMod). Details of the modeling assumptions and emission factors are provided in **Attachment A: Greenhouse Gas Emissions Data**. For construction, CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. GHG emissions during construction were forecasted based on the proposed construction schedule and applying the mobile-source and fugitive dust emissions factors derived from CalEEMod. The Project's construction-related GHG emissions would be generated from off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. The Project's operational-related GHG emissions would be generated by vehicular traffic, area sources (e.g., landscaping maintenance and consumer products), electrical generation demand, natural gas consumption, water supply and wastewater treatment, solid waste, water usage, and energy usage.

6.0 Impact Analysis

Threshold (a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Threshold (b) Would the project conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing greenhouse gas emissions?

Consistency with Applicable Plans and Policies

The Project would replace an older building that occupies the site currently and would be subject to compliance with all building codes in effect at the time of construction, which would include energy conservation measures mandated by Title 24 of the California Building Standards Code – Energy Efficiency Standards. Because Title 24 standards require energy conservation features in new construction (e.g., high- efficiency lighting, high-efficiency heating, ventilating, and air-conditioning [HVAC] systems, thermal insulation, double-glazed windows, water conserving plumbing fixtures), they indirectly regulate and reduce GHG emissions. California's Building Energy Efficiency Standards are updated on an approximately three-year cycle. The most recent 2019 standards went into effect January 1, 2020. The 2022 Energy Code and associated Title 24 standards went into effect January 1, 2023.

Consistency with the City of Monterey Park Climate Action Plan

In 2012, the City adopted the CAP which sets forth a comprehensive strategy to address GHG emissions related to land use patterns, transportation, building design, energy use, water demand, and waste generation. The Project's consistency with the CAP is analyzed in **Table 3: City of Monterey Park Climate Action Plan Measures Consistency**.

Table 3: City of Monterey Park Climate Action Plan Consistency

Measure	Description	Consistency
Building Efficiency		
E1. Efficiency Requirements for New Developments	The City, in coordination with the California Building Standards Commission and the California Energy Commission, will adopt energy efficiency regulations for new construction projects that comply with the 2008 California Green Building Code Tier 1 energy efficiency standards. The Tier 1 energy efficiency standards require a building's energy performance to exceed Title 24 standards by 15 percent for both	**Consistent**: The proposed Project would comply with California Green Building Standards Code (CCR Title 24, Part 11 Code) (CALGreen) which requires new residential and nonresidential buildings to comply with mandatory measures including energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. The Project would be required to comply with the provisions of the CALGreen standards. In addition,

Table 3: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
	residential and nonresidential development.	the Project would have three EV charging spaces.
E2. Building Retrofits	31 percent of total GHG emissions in the City are a result of energy used for commercial and residential buildings. Since the vast majority of buildings in the City were built before 2002, there is tremendous potential to increase the overall energy efficiency of buildings in the City with a range of energy efficiency upgrades.	**N/A**: This is not applicable to the Project. The Project would demolish and remove the existing improvements and construct a new data center. As building standards and efficiency has improved since the construction of the original building the replacement structure would be more energy efficient.
E3. Appliance Upgrade	The City will partner with SCE, the SoCal Gas, and the Metropolitan Water District to provide to increase awareness about rebate and incentive programs, the efficiencies that may be gained from Energy-Star-rated appliances, and the cost savings associated with Energy Star appliances.	**Consistent:** The Project would utilize energy efficient appliances and comply with the latest Title 24 energy efficiency requirements. In addition, the Project would not include natural gas.
E4. Smart Meters	Emerging energy management systems or Smart Meters are currently being stalled by SCE as a means to improve how electricity consumption is managed. These Smart Meters will eventually provide utility customers with access to detailed and instantaneous energy use and cost information, new pricing programs based on peak-energy demand, and the ability to program home appliances and devices to respond to cost, comfort, and convenience.	**Consistent:** The Project's utility provider (SCE) would install smart meters upon development.
Increase Renewable Energy Generation		
R1. Solar Water Heating	Solar hot water systems are a simple, reliable, and cost-effective method for harnessing the sun's energy to provide hot water. Solar collectors, usually placed on the roof, absorb the sun's energy to heat water that is stored in a water tank. Although solar water	**N/A:** The Project plumbing is not designed to include a hot water system that requires water to be stored in a water tank. Thus, this measure is not applicable. In any case, the Project would include rooftop design that is photovoltaic-system ready, which would allow solar energy to be distributed

Table 3: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
	heater upgrades require an up-front investment from the resident or business owner, there is a range of financing and rebate options available to offset these initial costs.	to project demand. See additional analysis under Measure R2.
R2. Solar Photovoltaic Systems	Solar photovoltaic (PV) systems generate electrical power by converting solar radiation into direct-current electricity using semiconductors. PV systems can be retrofitted into existing buildings, usually by mounting them onto an existing roof structure or walls. The City will promote PV installations to provide 5 percent of residential electricity and 2 percent of commercial electricity energy use from solar PV generation by 2020.	**Consistent:** The Project would construct new buildings on the Project Site that could accommodate limited solar photovoltaic systems on the roof to offset overall energy demand. Due to rooftop mechanical equipment, and related screening elements to comply with code, the solar PV systems cannot not occupy the entire roof area. Approximately 45,000 square feet could accommodate future photovoltaic installation, which could result in a maximum output between 750 to 900 kilowatts of energy. Nonetheless, the Project would include rooftop building design that is compatible with a solar photovoltaic system on a portion of the roofed areas.
Land Use		
LU1. Mixed Use Development	Increasing the availability, effectiveness, and use of transit could result in a 0.5 percent reduction in overall vehicle miles travelled (VMT) in the City by 2020. To meet the VMT reduction target, the City will create additional incentives to build and actively facilitate new mixed-use development near existing and planned transit corridors.	**N/A:** This is a municipal measure and not Project specific. This measure is intended to encourage and incentivize mixed-use development, which is not applicable to the Project. It should be noted that the land use policies in the CAP encourage infill and redevelopment, which is relevant to, and consistent with, the Project as it redevelops and existing infill site instead of developing undeveloped land.
LU2. Service Nodes	Through changes proposed under the new Zoning Ordinance, the City will provide more opportunities for walking, biking, and short-distance vehicular trips by promoting service nodes, which are employment centers with eating establishments, coffee	**N/A:** This is a municipal measure and not Project specific. Therefore, this measure is not applicable. It should be noted that the land use policies in the CAP encourage infill and redevelopment, which is relevant to, and consistent with, the Project as it redevelops and existing infill site instead of developing undeveloped land. It should

Table 3: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
	shops, day care, dry cleaners, and other services in proximity.	also be noted that the site is in a voter-enacted zone, thus the City amendments to the zoning ordinance are inapplicable here unless voter-enacted.
Transportation		
T1.1 Increase Transit Use: Lower Cost of Riding Transit	The City currently provides discounts to older adults on the purchase of transit passes, which are accepted locally and by regional transit providers. Pending funding availability, the City will expand the program to provide discounts to resident groups, such as students, or increase the subsidy in order to further promote transit use.	**Consistent:** This is a municipal measure and not specifically applicable to the Project. However, T1 encourages the City to expand transit programs to provide discounted transit passes to certain groups. These transit passes and programs would likely be available to employees of the Project who qualify for the City programs, and choose to ride transit to work, and hence the Project is consistent with implementation of this policy.
T1.2 Increase Transit Use: Promote Use of Transit Network	Promoting the availability of local and regional transit options is necessary to increase awareness and ridership. Therefore, the City will develop marketing or outreach programs to promote the use of the Spirit Bus and other transit options. The potential for VMT reduction with implementation of this action is 1% by 2020.	**N/A:** This is a municipal measure and not specifically applicable to the Project. Therefore, this measure is not applicable. It should be noted that the Project is a low VMT generator and would be compatible with any program the City develops to increase awareness of regional transit options, which the employees of the Project may use.
T2.1 Increase Walking and Biking: Expand Pedestrian Network and Increase Bicycle Parking.	The City will focus on implementation of traffic-calming projects and other necessary pedestrian amenities and safety improvements to enable walking as an attractive travel mode. The City will also identify opportunities to install bicycle parking in public areas and work with local employers to facilitate the expansion or provision of end-of-trip facilities.	**Consistent**: This is a municipal measure and not specifically applicable to the Project. However, the Project is consistent with this policy because it does would improve the pedestrian realm by improving the frontages surrounding the Project Site.
T2.2 Increase Walking and Biking Provide End-Of-Trip Facilities	The City will work with local employers to facilitate the expansion or provision of these facilities. As part of the outreach, the City will spotlight the facilities offered to its own employees,	**N/A:** This is a municipal measure and not specifically applicable to the Project. Therefore, this measure is not applicable.

Table 3: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
	which includes bike racks at City Hall, and changing rooms, lockers, and showers for most employees. Research has shown that VMT can be reduced by 2% to 5% through end-of-trip facilities. With 50% of the travel within the City associated with commuting, this action can achieve 1% VMT reduction by 2020.	
T3. Transportation Demand Management (TDM)	Transportation demand management (TDM) is a series of strategies that aim to reduce single-occupancy automobile trips. These strategies frequently target commute trips associated with employment within a community. Under this program, private companies with less than 250 employees would be encouraged, but not required, to implement a TDM program for their employees. The City will designate a TDM Coordinator who will promote these programs at local businesses, show case the current municipal program as an example, and encourage additional TDM at existing and future businesses.	**Consistent:** This is a municipal measure and not specifically applicable to the Project. In addition, the Project would have far fewer than 250 employees and therefore is not required to implement a TDM program. Nonetheless, the Project would not obstruct the efforts of the City's TDM Coordinator to promote TDM programs for local business, and as such is consistent with implementation of this policy by the City.
Water Conservation and Waste Reduction		
W1. Conserving Water	The City, in partnership with the San Gabriel Valley Water District, will continue to develop pilot or demonstration projects related to water conservation. The City will continue to work with the Water District to complete irrigation and revegetation of medians throughout the City with water-efficient irrigation equipment and native vegetation.	**Consistent:** The proposed Project would include landscaping on the site which would consist of native trees, shrubs, grasses, and groundcover, all of which would have very low or low water needs. The Project would include water efficient appliances per City and State codes. In addition, the Project is designed to include data center cooling technologies that minimize water use.
W2. Reducing Waste	This program allows the City to meet the 50 percent landfill diversion mandate required by State law while providing a service to residents and	**Consistent:** The proposed Project would be served by the local solid waste collection and recycling service that

Table 3: City of Monterey Park Climate Action Plan Consistency		
Measure	**Description**	**Consistency**
	businesses. In addition to the Materials Recovery Facility (MRF) program, the City has additional waste diversion and recycling programs, ranging from backyard composting/ smart gardening workshops to participation in County-wide Household Hazardous Waste collection events.	diverts waste consistent with City and State recycling and diversion targets.
Source: City of Monterey Park, 2012, City of Monterey Park Climate Action Plan, https://www.montereypark.ca.gov/DocumentCenter/View/581/Climate-Action-Plan?bidId=. Accessed April 22, 2024.		

As shown in **Table 3,** the proposed Project is consistent with the applicable policies within the City's CAP.

Consistency with the 2022 Scoping Plan

For the State of California, the 2022 Scoping Plan Update sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. The transportation, electricity, and industrial sectors are the largest GHG contributors in the State. The 2022 Scoping Plan Update plans to achieve the AB 1279 targets primarily through zero-emission transportation (e.g., electrifying cars, buses, trains, and trucks). Additional GHG reductions are achieved through decarbonizing the electricity and industrial sectors.

Statewide strategies to reduce GHG emissions in the latest 2022 Scoping Plan Update include implementing SB 100, which would achieve 100 percent clean electricity by 2045; achieving 100 percent zero emission vehicle sales in 2035 through Advanced Clean Cars II; and implementing the Advanced Clean Fleets regulation to deploy zero-electric vehicle buses and trucks. The 2022 Scoping Plan Update would continue to implement SB 375. GHGs would be further reduced through the Cap-and-Trade Program carbon pricing and SB 905. SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate carbon dioxide removal projects and technology. The Project would be compliant with CALGreen, including required number of EV chargers.

The 2022 Scoping Plan Update states that local CAPs that address the State's largest sources of emissions and prioritize transportation electrification, VMT reduction, and building decarbonization, contribute to the alignment between local climate action and the State's climate goals. As indicated above, the proposed Project would be consistent with the City's CAP. Further, project's GHG emissions associated with energy and mobile sources would be further reduced by the 2022 Scoping Plan Update measures described above. It should be noted that the City has no control over vehicle

emissions, however, these emissions would decline in the future due to Statewide measures discussed above, as well as cleaner technology and fleet turnover. In addition, the Project generates minimal VMT and daily traffic trips due to a limited number of employees required to work at and service the data center. Thus, the Project does not create substantial GHG emissions from vehicles in any case.

The Project would not impede the State's progress towards carbon neutrality by 2045 under the 2022 Scoping Plan. The Project would be required to comply with applicable current and future regulatory requirements promulgated through the 2022 Scoping Plan.

As noted above, the thresholds of significance for purposes of CEQA review are consistency with the lead agency's applicable plans regarding reduction of GHG emissions. Nevertheless, for contextual purposes, the Project would not conflict with implementation of the 2022 Scoping Plan.

In conclusion, the Project would not conflict with an applicable plan, policy, or regulation of the lead agency adopted for the purpose of reducing GHG emissions. Therefore, the proposed Project would not result in significant effects.

Quantification of Project Emissions

Short-Term Construction Greenhouse Gas Emissions

The Project would result in direct emissions of GHGs from construction. Construction of the Project would result in direct emissions of CO_2, N_2O, and CH_4 related to the operation of construction equipment, and the transport of materials and construction workers to and from the Project site. The SCAQMD advises that construction GHG emissions be summed and amortized over the lifetime of a project (assumed to be 30 years), then the yearly amount be added to the operational emissions.[10] The annual GHG emissions generated by construction of the Project is shown in **Table 4: Construction Greenhouse Gas Emissions.**

[10] The amortization period of 30-years is based on the standard assumption of the South Coast Air Quality Management District (South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #13,* August 26, 2009).

Table 4: Construction Greenhouse Gas Emissions	
Year	**$MTCO_2e$ per year**
Construction (2025)	511
Construction (2026)	471
Construction (2027)	237
Total	1,219
Amortized Over 30 Years	40.63
Source: CalEEMod version 2022.1. Refer to **Attachment A** for model outputs.	

As shown, the Project would result in the generation of a maximum of 511 $MTCO_2e$ and a minimum of 237 $MTCO_2e$ per year during construction, with an amortized 40.63 $MTCO_2e$ annually. The total GHG construction emissions were amortized over the 30-year lifetime of the Project (i.e., total construction GHG emissions were divided by 30 to determine the annual construction emissions estimate that can be added to the Project's operational emissions) in order to determine the Project's annual GHG emissions inventory. Once construction is complete, the generation of these GHG emissions would cease. Neither the City nor SCAQMD have an adopted threshold of significance for construction related GHG emissions. Therefore, GHG emissions related to construction were quantified and disclosed in this report for informational purposes only.

Long-Term Operational Greenhouse Gas Emissions

Operational or long-term emissions would occur over the life of the proposed Project. GHG emissions would result from area sources (consumer products, landscape maintenance equipment, and painting), vehicular traffic, and diesel fuel associated with the emergency generators. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power, the energy required to convey water to, and wastewater from the Project, the emissions associated with solid waste generated from the Project, and any fugitive refrigerants from air conditioning or refrigerators.

The Project electricity usage would be mainly from the operation of the data center. The purpose of a data center is to house computer servers, which require electricity and cooling 24 hours a day to operate. Based on data received from the Applicant, the Project during peak load conditions would have a demand of 49,999 kilowatts per hour (KW/h). The analysis assumes 24/7 operations (8,760 hours per year) which would result in a maximum electrical usage of 437,991 megawatt hours (MWh) per year, including CalEEMod default assumptions for lighting for surface parking. The modeling also conservatively assumed the 14 gen-sets would be used for up to 50 hours per year per generator for testing and maintenance. The generators would utilize diesel fuel.

Power Usage Effectiveness During Operation

Power usage effectiveness (PUE) is a metric to calculate the ratio of total facility power over IT equipment energy. Total facility power is the amount of power the facility uses which includes data center hardware, power delivery components, cooling and lighting systems. Whereas IT equipment includes energy related to the storage and networking equipment, and control equipment. The ideal PUE is one (1) where all power drawn by the facility goes to the IT infrastructure. The average PUE in 2019 was 1.67.[11] The proposed Project is anticipated to have a blended PUE of 1.2 due to free cooling modules on the air-cooled chillers, below the average for data centers. The proposed Project would be more efficient than the average data center.

Total GHG emissions associated with the Project are summarized in **Table 5: Operational Greenhouse Gas Emissions Opening Year**. The Project Site includes an office building that has been vacant since 2016. While the Project conservatively does not take credit for the historical emissions, there was a use on site in 2012 when the CAP was being prepared for the City. Therefore, net emissions would be less than shown in the table.

Table 5: Operational Greenhouse Gas Emissions Opening Year

Emissions Source	$MTCO_2e$ per Year[1]
Amortized Construction Emissions	41
Area Source	5
Emergency Generators [2]	2,062
Mobile	80
Waste	70
Water and Wastewater	27
Refrigeration	0.1
Energy[3]	83,020
Total Emissions	85,305

1. Total values are from CalEEMod and may not add up due to rounding.
2. Emergency backup generator emissions calculated assuming 50 hours per year per generator (14 generators).
3. The servers in the data center were estimated to require approximately 50 MW of power per hour, and operations were conservatively estimated to be 8,760 hours per year. Total MW per year would be 437,991. Total CO_2e in tons per year would be 83,020. The Project does not include natural gas heaters or water heaters.

Source: CalEEMod version 2022.1. Refer to **Attachment A** for model outputs.

[11] Uptime Institute, Annual Data Center Survey Results, 2019, https://datacenter.com/wp-content/uploads/2019/06/data-center-survey-2019.pdf. Accessed May 7, 2024.

As shown above in **Table 5**, the emissions related to electricity use by the data center is a majority of the emissions. Southern California Edison (SCE) is the utility providing electricity to the Project site. SCE's carbon intensity factor in 2022 was 552 lbs CO_2e/MWh which includes 33.2 percent eligible renewable energy in the power mix.[12] Emissions associated with the Project's electricity consumption occur at power production facilities which are covered entities under the State's Cap-and-Trade regulations, which limit total GHG emissions by covered sources with decreasing allocations, and are subject to the RPS standard requiring the GHG intensity of electricity production to decrease steadily. These regulatory schemes serve as the foundation for the State's goal of net neutrality in 2045. Likewise, the implementation of these Statewide measures, including but not limited to SCE procuring and delivery electricity from renewable energy sources result in an annual reduction of GHG emissions associated with operation of the Project.

The Cap-and-Trade program covers approximately 80 percent of California's GHG emissions.[13] The statewide limit on GHG emissions from the capped sectors (i.e., electricity generation, industrial sources, petroleum refining, and cement production) will decline every year, achieving GHG emission reductions throughout the program's duration. The passage of AB 398 in July 2017 extended the duration of the Cap-and-Trade program from 2020 to 2030. The Cap-and-Trade program was extended in 2015 to cover combustion of fossil fuels including transportation fuels used in California. Accordingly, GHG emissions associated with the electricity usage and mobile sources of most projects that are subject to CEQA are covered by the Cap-and-Trade program.

Table 6: Trend of Project Greenhouse Gas Emissions Related to State Mandates shows the Project emissions in the opening year 2027, in 2035, consistent with the City's CAP horizon, and in 2045, the year the State will meet its carbon neutrality goal. **Table 6** also highlights the reduction in mobile emissions as passenger vehicle fleets become cleaner and technology improves. The trends show a steady decrease in Project GHG emissions, consistent with the overarching goals of the State's 2022 Scoping Plan and the City's CAP.

[12] Southern California Edison, 2022 Power Content Label, https://www.energy.ca.gov/filebrowser/download/6072. Accessed April 22, 2024.

[13] California Air Resources Board, Cap-and-Trade Program: Frequently Asked Questions, September 2022. https://ww2.arb.ca.gov/sites/default/files/2022-09/nc-FAQ_CT.pdf. Accessed April 22, 2024.

Table 6: Trend of Project Greenhouse Gas Emissions Related to State Mandates			
	Annual Emissions ($MTCO_2e$ per Year)[1]		
Emissions Source	**2027 (Project Opening)**	**2035 (CAP Horizon)**	**2045 (CA GHG Neutrality)**
Mobile	80	71	67
Area	5	5	5
Energy[2]	83,020	62,657	0
Water	21	18	0
Waste	70	70	70
Generators	2,062	2,062	2,062
Total	85,258	64,883	2,204
1. Total values are from CalEEMod and may not add up due to rounding. 2. The Project does not include natural gas. GHG emissions from electricity are shown to decline in accordance with State mandates and regulations including RPS standard that requires an increasing amount of renewable energy electric utilities procure to comply with the various goals including 50 percent eligible renewable energy resources in 2030. In line with the Governor's mandate emissions in 2045 are shown to achieve the carbon neutrality goal.			
Source: CalEEMod version 2022.1. Refer to **Attachment A** for model outputs.			

As shown above in **Table 5** and **Table 6**, the majority of GHG emissions associated with the Project is the electricity energy use (approximately 97 percent). Because GHG emissions from covered entities are accounted for in the State's GHG future inventories and reduction targets and are subject to existing regulatory schemes to reduce emissions, those emissions are considered consistent with the 2022 Scoping Plan Update.

The Project would include a variety of energy efficiency measures including all applicable City and State green building measures such as California Code of Regulations Title 24, Part 6 (Energy Code) and Part 11 (CALGreen). The Project is designed to minimize wasteful energy consumption, with a projected PUE much lower than the average achieved by data centers. In addition, the Project would be consistent with applicable CAP goals (discussed in detail above) aimed to reduce GHG emissions.

Mitigation Measure: No mitigation is required.

Level of Significance: Less than Significant Impact.

Conclusion

The Project would not conflict with applicable regulatory plans and policies of the lead agency adopted for purposes of reducing emissions of GHGs. Furthermore, because the Project is consistent with such plans, the Project's incremental increase in GHG emissions would not result in a significant

impact on the environment. Therefore, Project implementation would result in less than significant construction and operational GHG impacts. No mitigation measures would be required.

Data Field	Value
Project Name	Saturn Data Center Project - Operations
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	0.50
Precipitation (days)	18.2
Location	1977 Saturn St, Monterey Park, CA 91755, USA
County	Los Angeles-South Coast
City	Monterey Park
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	4170
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.22

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
General Office Building	218	1000sqft	5.01	218,400	113,291	0.00	—	—

Parking Lot	68.0	Space	0.61	0.00	0.00	0.00	—	—
General Office Building	24.0	1000sqft	0.55	24,000	0.00	0.00	—	Proxy for Substation

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat

Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	63.0
Healthy Places Index Score for Project Location (b)	48.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification

Operations: Vehicle Data	Changes according to Project Trip Rate
Operations: Energy Use	Values provided by client.
Operations: Water and Waste Water	Values provided by client.

Saturn Data Center Project - Operations 2035 Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Saturn Data Center Project - Operations 2035
Operational Year	2035
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	0.50
Precipitation (days)	18.2
Location	1977 Saturn St, Monterey Park, CA 91755, USA
County	Los Angeles-South Coast
City	Monterey Park
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	4170
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.22

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
General Office Building	218	1000sqft	5.01	218,400	113,291	0.00	—	—

Parking Lot	68.0	Space	0.61	0.00	0.00	0.00	—	—
General Office Building	24.0	1000sqft	0.55	24,000	0.00	0.00	—	Proxy for Substation

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat

Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3
Pesticides	36.2

Toxic Releases	81.8
Traffic	97.9
Effect Indicators	—
CleanUp Sites	68.9
Groundwater	0.00
Haz Waste Facilities/Generators	60.2
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	17.4
Cardio-vascular	7.94
Low Birth Weights	49.3
Socioeconomic Factor Indicators	—
Education	66.5
Housing	54.1
Linguistic	71.2
Poverty	43.7
Unemployment	77.1

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	40.31823431
Employed	23.22597203
Median HI	54.35647376
Education	—

Bachelor's or higher	44.23200308
High school enrollment	100
Preschool enrollment	79.96920313
Transportation	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	63.0
Healthy Places Index Score for Project Location (b)	48.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat

Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3
Pesticides	36.2

Toxic Releases	81.8
Traffic	97.9
Effect Indicators	—
CleanUp Sites	68.9
Groundwater	0.00
Haz Waste Facilities/Generators	60.2
Impaired Water Bodies	0.00

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit

Temperature and Extreme Heat	16.2	annual days of extreme heat
Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

PARTNER

April 17, 2024

Mr. Chris Flynn
SDFC Monterey Park, LLC
660 Steamboat Road
Greenwich, Connecticut 06830

Subject: Phase I Environmental Site Assessment
1977 Saturn
1977 Saturn Street
Monterey Park, California 91755
Partner Project No. 24-444561.1

Dear Mr. Flynn:

Partner Engineering and Science, Inc. (Partner) is pleased to provide this Phase I Environmental Site Assessment (Phase I ESA) report of the abovementioned address (the "subject property"). This assessment was performed in conformance with the scope and limitations as detailed in the ASTM Practice E1527-21 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process and Client Agreement.

This assessment included a site reconnaissance as well as research and interviews with representatives of the public, property ownership, site manager, and regulatory agencies. An assessment was made, conclusions stated, and recommendations outlined.

We appreciate your trust in Partner and the opportunity to provide environmental services to you. If you have any questions concerning this report, or if we can assist you in any other matter, please contact me at 513-315-7931.

Sincerely,

Robert Knight
National Client Manager

EXECUTIVE SUMMARY

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in accordance with the scope of work and limitations of ASTM Practice E1527-21, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) and set forth by SDFC Monterey Park, LLC for the property located at 1977 Saturn Street in Monterey Park, Los Angeles County, California (the "subject property"). The Phase I Environmental Site Assessment is designed to provide SDFC Monterey Park, LLC with an assessment concerning environmental conditions (limited to those issues identified in the report) as they exist at the subject property.

Property Description

The subject property is located on the northern side of Saturn Street and western side of South Orange Avenue within a residential and commercial area of Los Angeles County. Please refer to the table below for a further description of the subject property:

Subject Property Data	
Address:	1977 Saturn Street, Monterey Park, California
Additional Current Address(es):	None Identified
Historical Address(es):	None Identified
Property Use:	Commercial
Land Acreage (Ac):	16.026 Ac
Number of Buildings:	Two (Main Building and Generator Building)
Number of Floors:	Main Building: Two-story; Generator Building: One-story
Gross Building Area (SF):	209,597 SF
Net Rentable Area (SF):	205,628 SF
Date of Construction:	1979
Parcel Number:	5265-026-054
Type of Construction:	Structural steel-framed
Current Tenants:	vacant, two-story, split-level commercial building for commercial use
Site Assessment Performed By:	Adrian Gutierrez of Partner
Site Assessment Conducted On:	April 12, 2024
Regulatory Radius Report Date:	April 4, 2024
Lien Search Date:	N/A
Report Date:	April 17, 2024
FOIAs Date:	April 2024

The subject property improved with a vacant, two-story, split-level commercial building for commercial use. Onsite operations consist of routine general property management and maintenance. In addition to the current structures, the subject property is also improved with a hydraulic passenger elevator, asphalt-paved parking areas, concrete-paved walkways and flatwork, four loading docks, a generator building housing an emergency diesel generator on the northern portion, a utility building housing utility service equipment on the southern portion, a three-stage clarifier on the southern exterior of the subject property building, a plugged dry hole on the southwestern portion, stormwater drainage features, and associated landscaping.

According to available historical sources, the subject property was formerly undeveloped land as early as 1894 to as late as 1976 and developed with the current structure in 1979. Tenants on the subject property

have included Lloyds Bank (1979-1984), Sanwa Bank (1986-2007), United California Bank (2002), Union California Bank (2003), FIS (2016), and Bank of the West (2008-2016).

The adjoining properties are tabulated below:

Adjoining Properties	
North:	Residential (2204 Iris Way), La Loma Park (1950 Fulton Avenue), La Loma Reservoir (1980 Clover Drive)
Northeast:	Chuy's Nursery (1996 South Orange Avenue)
East:	Across South Orange Avenue, vacant land
South:	South Saturn Street, commercial office building (1938, 1968 Saturn Street), MUFG and parking lots (1980 Saturn Street)
West:	Residential (2000 Clover Drive), commercial office building (2001 Saturn Street)

According to topographic map interpretation and a previous subsurface investigation conducted on the subject property, the physical setting features of the subject property identify the terrain as sloping to the west-southwest with the depth to groundwater in the vicinity of the subject property is inferred to be approximately 4 to 11.5 feet below ground surface (bgs) and groundwater flow inferred to be toward the west-southwest.

Findings and Opinions

Recognized Environmental Condition

A recognized environmental condition (REC) refers to the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment.

- Partner did not identify any RECs during the course of this assessment.

Controlled Recognized Environmental Condition

A controlled recognized environmental condition (CREC) refers to a REC affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of required controls (for example, activity and use limitations or other property use limitations). The following was identified during the course of this assessment:

- According to available historical sources and previous reports, the subject property, identified as BRE CA Saturn, LLC at 1977 Saturn Street, is listed as a Non-Case Information site under the regulatory oversight of the Los Angeles Regional Water Quality Control Board (RWQCB) (Case Number T10000018576). According to information made available on the State Water Resources Control Board (SWRCB) GeoTracker database, along with review of regulatory database listings and previous environmental reports, Case Number T10000018576 was previously recorded as a Leaking Underground Storage Tanks (LUST) Cleanup site in association with removal and assessment activities, conducted under the oversight of the Los Angeles County Department of Public Works (LACDPW), for three historical underground storage tanks (USTs) installed on the subject property. According to available regulatory records, building records, and previous reports two 10,000-gallon, single-walled, fiberglass, diesel fuel USTs (Tanks 1 and 2) were installed on the northern exterior of the subject property building in 1980 and one, 2,500-gallon steel double-walled, fiberglass coated, diesel fuel UST (Tank 3) was installed on the western exterior of the generator building located on the northern portion of the subject property in 1991. The three USTs operated

to supply an on-site emergency generator system associated with former tenants of the subject property.

According to a Soil Sampling Results Related to UST System Removals report prepared by AEM and dated December 7, 2018, upon removal of the USTs in 2018, soil samples and groundwater samples were collected and analyzed for total petroleum hydrocarbons as diesel (TPH-d), benzene, toluene, ethylbenzene, and xylenes (BTEX), and fuel oxygenates in accordance with modified Environmental Protection Agency (EPA) method no. 8015 (for TPH-d) and EPA method no. 5035/8260B (for BTEX and fuel oxygenates). Two detections of TPH-d were reported in a sample collected from beneath the piping system (15.2 milligrams per kilogram [mg/kg]) and at 10 feet bgs in the sidewall of the Tank 3 tank pit (10.5 mg/kg). BTEX and fuel oxygenates were not detected above their respective laboratory method reporting limits in any of the soil or groundwater samples and TPH-d was not detected above the laboratory method reporting limit in either of the groundwater samples.

On April 27, 2020, the LADCPW issued a letter to the RWQCB that indicated their review of the 2018 Soil Sampling Results Related to UST System Removals report and referral of the matter to the RWQCB for further action. According to a letter prepared by the Los Angeles RWQCB and dated June 28, 2022, based on their review of the documentation, the Los Angeles RWQCB determined that "residual concentrations of fuel constituents in the areas of the three historic USTs pose low threat to human health and the environment." Therefore, no further action was required. Furthermore, the Los Angeles RWQCB indicated that subject property "data indicated that there may be residual concentrations of pollutants in soil at the subject property that could pose an unacceptable risk as a result of future construction/redevelopment activities, and/or change to a more sensitive land use from commercial use. Responsible parties, landowners, and contractors performing subsurface activities at the site should be prepared to manage properly to avoid threats to human health or the environment."

Based on the regulatory closure, reported removal of the identified USTs, completion of assessment and remedial activities, and indicated analytical results meeting the applicable regulatory standards for commercial use, the historical USTs and closed LUST case are considered a CREC and no further investigation appears warranted at this time.

Historical Recognized Environmental Condition

A historical recognized environmental condition (HREC) refers to a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations).

- Partner did not identify any HRECs during the course of this assessment.

Business Environmental Risk

A Business Environmental Risk (BER) is a risk which can have a material environmental or environmentally driven impact on the business associated with the current or planned use of commercial real estate, not necessarily related to those environmental issues required to be investigated in this practice. The following was identified during the course of this assessment:

- Due to the age of the subject property buildings, there is a potential that asbestos-containing material (ACM) are present. Readily visible suspect ACMs were observed in good condition. Should these materials be replaced, the identified suspect ACMs would need to be sampled to confirm the

presence or absence of asbestos prior to any renovation or demolition activities to prevent potential exposure to workers and/or building occupants.

Significant Data Gaps

No significant data gaps affecting the ability of the Environmental Professional to identify a REC were encountered during this assessment.

Conclusions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-21 of 1977 Saturn Street in Monterey Park, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of RECs and HRECs in connection with the subject property; however, a CREC and BER were identified. Based on the conclusions of this assessment, Partner recommends the following:

- Partner recommends preparation of a Soil Management Plan to address potential soils with residual impacts remaining on the subject property during any future construction/redevelopment activities.

Appendix B: Historical/Regulatory Documentation
Appendix C: Regulatory Database Report
Appendix D: Qualifications

1.0 INTRODUCTION

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of ASTM Practice E1527-21 and the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) for the property located at 1977 Saturn Street in Monterey Park, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this scope of work are described in the report.

1.1 Purpose

The purpose of this ESA is to identify existing or potential Recognized Environmental Conditions (as defined by ASTM Standard E1527-21) affecting the subject property that: 1) constitute or result in a material violation or a potential material violation of any applicable environmental law; 2) impose any material constraints on the operation of the subject property or require a material change in the use thereof; 3) require clean-up, remedial action or other response with respect to Hazardous Substances or Petroleum Products on or affecting the subject property under any applicable environmental law; 4) may affect the value of the subject property; and 5) may require specific actions to be performed with regard to such conditions and circumstances. The information contained in the ESA Report will be used by Client to: 1) evaluate its legal and financial liabilities for transactions related to foreclosure, purchase, sale, loan origination, loan workout or seller financing; 2) evaluate the subject property's overall development potential, the associated market value and the impact of applicable laws that restrict financial and other types of assistance for the future development of the subject property; and/or 3) determine whether specific actions are required to be performed prior to the foreclosure, purchase, sale, loan origination, loan workout or seller financing of the subject property.

This ESA was performed to permit the User to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) liability (hereinafter, the "landowner liability protections," or "LLPs"). ASTM Standard E1527-21 constitutes "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35)(B).

1.2 Scope of Work

The scope of work for this ESA is in accordance with and to the extent necessary to achieve the goal of the requirements set forth in the ASTM Standard E1527-21. This assessment included: 1) a property and adjoining site reconnaissance; 2) interviews with key personnel; 3) a review of historical sources; 4) a review of regulatory agency records; and 5) a review of a regulatory database report provided by a third-party vendor. Partner contacted local agencies, such as environmental health departments, fire departments and building departments to obtain readily ascertainable information to determine any current and/or former hazardous substances usage, storage and/or releases of hazardous substances on the subject property. Additionally, Partner researched readily available information on the presence of activity and use limitations (AULs) at these agencies. As defined by ASTM E1527-21, AULs include both legal (that is, institutional) and physical (that is, engineering) controls that may include legal or physical restrictions or limitations on the use of, or access to, a site or facility: 1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil, soil vapor, groundwater, or surface water on the subject property; or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls (IC/ECs), are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil, soil vapor, groundwater, and/or surface water on a property.

If requested by Client, this report may also include the identification, discussion of, and/or limited sampling of asbestos-containing materials (ACMs), lead-based paint (LBP), mold, and/or radon.

1.3 Limitations

Partner warrants that the findings and conclusions contained herein were accomplished in accordance with the methodologies set forth in the Scope of Work. These methodologies are described as representing good commercial and customary practice for conducting an ESA of a property for the purpose of identifying recognized environmental conditions. There is a possibility that even with the proper application of these methodologies there may exist on the subject property conditions that could not be identified within the scope of the assessment or which were not reasonably identifiable from the available information. Partner believes that the information obtained from the record review and the interviews concerning the subject property is reliable. However, Partner cannot and does not warrant or guarantee that the information provided by these other sources is accurate or complete. The conclusions and findings set forth in this report are strictly limited in time and scope to the date of the evaluations. The conclusions presented in the report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed-upon services or the time and budgeting restraints imposed by the Client. No other warranties are implied or expressed.

Some of the information provided in this report is based upon personal interviews, and research of available documents, records, and maps held by the appropriate government and private agencies. This report is subject to the limitations of historical documentation, availability, and accuracy of pertinent records, and the personal recollections of those persons contacted.

This practice does not address requirements of any state or local laws or of any federal laws other than the all appropriate inquiry provisions of the LLPs. Further, this report does not intend to address all of the compliance and safety concerns, if any, associated with the subject property.

Environmental concerns, which are beyond the scope of a Phase I ESA as defined by ASTM include the following: ACMs, LBP, radon, and lead in drinking water. These issues may affect environmental risk at the subject property and may warrant discussion and/or assessment; however, are considered non-scope issues. If specifically requested by the Client, these non-scope issues are discussed in Section 6.3.

1.4 User Reliance

SDFC Monterey Park, LLC (herein referred to as Client) engaged Partner to perform this assessment in accordance with an agreement governing the nature, scope and purpose of the work as well as other matters critical to the engagement. All reports, both verbal and written, are for the sole use and benefit of Client. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with Partner granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against Partner, its officers, employees, vendors, successors or assigns. Any such unauthorized user shall be responsible to protect, indemnify and hold Partner, Client and their respective officers, employees, vendors, successors and assigns harmless from any and all claims, damages, losses, liabilities, expenses (including reasonable attorneys' fees) and costs attributable to such Use. Unauthorized use of this report shall constitute acceptance of and commitment to these responsibilities, which shall be irrevocable and shall apply regardless of the cause of action or legal theory pled or asserted. Additional legal penalties may apply.

This report has been completed under specific Terms and Conditions relating to scope, relying parties, limitations of liability, indemnification, dispute resolution, and other factors relevant to any reliance on this report. Any parties relying on this report do so having accepted the Terms and Conditions for which this report was completed. A copy of Partner's standard Terms and Conditions can be found at http://www.partneresi.com/terms-and-conditions.php.

1.5 Limiting Conditions

The findings and conclusions contain all the limitations inherent in these methodologies that are referred to in ASTM Practice E1527-21.

Specific limitations and exceptions to this ESA are more specifically set forth below:

- Interviews with past or current owners, operators and occupants were not reasonably ascertainable and thus constitute a data gap. Based on information obtained from other historical sources, this data gap is not expected to alter the findings of this assessment.
- Partner requested information relative to deed restrictions and environmental liens, a title search, and completion of the AAI User Questionnaire from the Report User. This information was not provided at the time of the assessment. This data gap is not expected to alter the findings of this assessment.
- Partner was unable to determine the property use at five-year intervals, which constitutes a data gap. Except for property tax files and recorded land title records, which were not considered to be sufficiently useful, Partner reviewed all standard historical sources and conducted appropriate interviews. This data gap is not expected to alter the findings of this assessment.

Due to time constraints associated with this report, the Client has requested the report despite the above-listed limitations.

2.0 SITE DESCRIPTION

2.1 Site Location and Legal Description

The subject property at 1977 Saturn Street in Monterey Park, California is located on the northern side of Saturn Street and western side of South Orange Avenue. According to the Los Angeles County Assessor, the subject property is legally described as *(EX OF ST) LOT 5*TR=PARCEL MAP AS PER BK 80 P 45-46 OF P M AND (EX OF ST) LOTS 1 THRU 3 AND 16 TRACT NO 33910. According to the Los Angeles County Assessor, ownership has been vested in BRE CA Saturn, LLC since 2018.

Please refer to Figure 1: Site Location Map, Figure 2: Site Plan, Figure 3: Topographic Map, and Appendix A: Site Photographs for the location and site characteristics of the subject property.

2.2 Current Property Use

The subject property improved with a vacant, two-story, split-level commercial building for commercial use. Onsite operations consist of routine general property management and maintenance. The subject property consists of a split level construction comprised of Levels A and C on the western portion and Levels B and D on the on the eastern portion In addition to the current structures, the subject property is also improved with a hydraulic passenger elevator, asphalt-paved parking areas, concrete-paved walkways and flatwork, four loading docks, a generator building housing an emergency diesel generator on the northern portion, a utility building housing utility service equipment on the southern portion, a three-stage clarifier on the southern exterior of the subject property building, a plugged dry hole on the southwestern portion, stormwater drainage features, and associated landscaping.

The subject property is designated as “Office Professional (O-P Voter Enacted)” with Innovation/Technology land use designation for commercial development by the City of Monterey Park.

The subject property was identified as a Los Angeles County- CUPA Program Records (CUPA LA COUNTY); Delisted California Environmental Reporting System Tanks (DELISTED CTNK); Delisted Leaking Storage Tanks (DELISTED LST); Delisted Storage Tanks (DELISTED TNK); Toxic Pollutant Emissions Facilities (EMISSIONS); Facility Registry Service/Facility Index (FINDS/FRS); Sites in GeoTracker (GEOTRACKER); Generators from Hazardous Waste Manifest Data (HAZ GEN); Historical Hazardous Waste Manifest Data (HIST MANIFEST); Los Angeles County - HMS List (HMS LA); RCRA Non-Generators (RCRA NON GEN); RCRA Small Quantity Generators List (RCRA SQG); Permitted Underground Storage Tank in GeoTracker (UST); and Statewide Environmental Evaluation and Planning System (UST SWEEPS) site in the regulatory database report of Section 4.2.

2.3 Current Use of Adjoining Properties

The subject property is located within a residential and commercial area of Los Angeles County. During the vicinity reconnaissance, Partner observed the land uses on adjoining properties as defined in ASTM Practice E1527-21 as any real property or properties the border of which is contiguous or partially contiguous with that of the property, or that would be contiguous or partially contiguous with that of the property but for a street, road, or other public thoroughfare separating them. The adjoining properties are tabulated below:

Adjoining Properties	
North:	Residential (2204 Iris Way), La Loma Park (1950 Fulton Avenue), La Loma Reservoir (1980 Clover Drive)
Northeast:	Chuy’s Nursery (1996 South Orange Avenue)
East:	Across South Orange Avenue, vacant land
South:	South Saturn Street, commercial office building (1938, 1968 Saturn Street), MUFG and parking lots (1980 Saturn Street)

Adjoining Properties	
West:	Residential (2000 Clover Drive), commercial office building (2001 Saturn Street)

The adjoining properties were identified as California Environmental Reporting System Tanks (CERS TANK), CUPA LA COUNTY, DELISTED TNK, EMISSIONS, FINDS/FRS, HAZ GEN, Handlers from Hazardous Waste Manifest Data (HAZNET), HIST MANIFEST, HMS LA, RCRA NON GEN, UST, UST SWEEPS, and/or DELISTED CTNK sites in the regulatory database report of Section 4.2.

2.4 Physical Setting Sources

2.4.1 Topography

The 2022 United States Geological Survey (USGS) El Monte and Los Angeles, California Quadrangle 7.5-minute series topographic map was reviewed for this ESA. According to the contour lines on the topographic map, the subject property elevation ranges from approximately 360 to 420 feet above mean sea level (MSL). The contour lines in the area of the subject property indicate the area is sloping moderately towards the west-southwest.

A copy of the most recent topographic map is included as Figure 3 of this report.

2.4.2 Hydrology

While under natural and undisturbed conditions shallow groundwater flow most frequently follows the topography of the land surface, natural or man-made features can affect flow direction, and the presumed flow may not match the actual flow directions at the subject property and vicinity. Topographic map interpretation suggests the direction of groundwater flow in the vicinity of the subject property is inferred to be toward the west-southwest.

According to a previous subsurface investigation conducted on the subject property, the depth to groundwater in the vicinity of the subject property is inferred to be approximately 4 to 11.5 feet bgs.

The nearest surface water in the vicinity of the subject property is Garvey Reservoir located approximately 0.4-mile north of the subject property. No settling ponds, lagoons, surface impoundments, wetlands or natural catch basins were observed at the subject property during this assessment.

According to available information, a public water system operated by the Monterey Park Public Works Water Department serves the subject property vicinity. The sources of public water for the City of Monterey Park are groundwater from the Main San Gabriel Groundwater Basin (Main Basin) and water purchased from the San Gabriel Water Company, which also pumps groundwater from the Main Basin. No public supply wells were identified at the subject property of the adjoining properties. .

2.4.3 Geology/Soils

The subject property is situated within the Peninsular Ranges Physiographic Province of the State of California. The Peninsular Ranges is a series of ranges separated by northwest trending valleys, subparallel to faults branching from the San Andreas Fault. The trend of topography is similar to the Coast Ranges, but the geology is akin the Sierra Nevada, with granitic rock intruding the older metamorphic rocks. The Peninsular Ranges extend into lower California and are bounded on the east by the Colorado Desert. According to the Environmental Risk Information Services (ERIS) Physical Setting Report, the shallow subsurface directly beneath the subject property consists of Miocene to Pleistocene Pliocene marine rocks comprised of sandstone, siltstone, shale, and conglomerate.

Based on information obtained from the United States Department of Agriculture (USDA) Natural Resources Conservation Service Web Soil Survey online database, the subject property is mapped as Urban land-Montebello-Xerorthents complex and Counterfeit-Urban land complex. Urban land is described as areas where soils have been significantly altered in the past due to anthropogenic activities. The

Montebello series consists of deep, well-drained soils that are formed in human-transported materials on graded alluvial fans that originate from granitic sources. Xerorthents refers to man-modified material, including soils rearranged in a cut and fill or as tailings heaps. The Counterfeit series consists of deep soils that formed from human-transported material which originated from material weathered from calcareous sedimentary rocks. Slopes range from 0 to 35 percent.

2.4.4 Flood Zone Information

Partner performed a review of the Flood Insurance Rate Map, published by the Federal Emergency Management Agency. According to Community Panel Number 06037C1665F, dated September 26, 2008, the subject property appears to be located in Zone X (unshaded); defined as minimal risk areas outside the 1-percent and 0.2-percent-annual-chance floodplains.

A copy of the reviewed flood map is included in Appendix B of this report.

3.0 HISTORICAL INFORMATION

Partner obtained historical use information about the subject property from a variety of sources. A chronological listing of the historical data found is summarized in the table below:

Historical Use Information		
Years	**Resource**	**Description/Use**
1894-1976	Aerial Photographs, Previous Report, Topographic Maps	Undeveloped land
1979-Present	Aerial Photographs, Building Records, City Directories, Client-Provided Information, Los Angeles County Assessor Records, Previous Report, Site Observations	Commercial

Tenants on the subject property have included Lloyds Bank (1979-1984), Sanwa Bank (1986-2007), United California Bank (2002), Union California Bank (2003), FIS (2016), and Bank of the West (2008-2016).

Partner's review of historical documentation, agency records, and previous reports indicates that the subject property was historically occupied by a printing facility/micro-film laboratory from as early as 1982 to an unknown date (likely 2016, according to generated regulated hazardous waste on-site documented on the California Department of Toxic Substances Control [DTSC]- Hazardous Waste Tracking System [HWTS] database). Based on the operation during a time of stringent regulatory oversight, lack of violations or compliance deficiencies noted, and lack of information indicating an unauthorized release of hazardous materials, the historical use of the subject property as a printing facility/micro-film laboratory is not considered to represent a significant environmental concern and no further investigation appears warranted.

Potential environmental concerns were identified in association with the former use of the subject property, as further discussed in Sections 3.3 and 4.0.

3.1 Aerial Photograph Review

Partner obtained available aerial photographs of the subject property and surrounding area from Environmental Risk Information Services (ERIS). The inferred uses of the subject property and adjoining properties as interpreted from the aerial photographs in Appendix B are tabulated below:

Date:	***1927, 1938, 1948***	***Scale:***	***1"=500'***
Subject Property:	Appears to be undeveloped land with an apparent channel stream and unpaved road are visible on the southern section		
North:	Appears to be undeveloped land		
Northeast:	Appears to be undeveloped land		
East:	Appears to be undeveloped land		
South:	Appears to be undeveloped land		
West:	Appears to be undeveloped land		

Date:	1956, 1964	Scale:	1"=500'
Subject Property:	No significant changes visible		
North:	Appears to be developed with the current residential structure on the eastern section and one of the two current water tanks on the eastern section		
Northeast:	Appears to be undeveloped land with an apparent channel		
East:	No significant changes visible		
South:	No significant changes visible		
West:	Appears to be developed with the current residential structure on the northern section		

Date:	1972, 1976	Scale:	1"=500'
Subject Property:	No significant changes visible		
North:	Appears to be developed with the current park on the central section		
Northeast:	No significant changes visible		
East:	No significant changes visible		
South:	No significant changes visible		
West:	No significant changes visible		

Date:	1987, 1994	Scale:	1"=500'
Subject Property:	Appears to be developed with the current commercial structure on the central section and parking areas on the remaining areas		
North:	No significant changes visible		
Northeast:	Appears to be agricultural land		
East:	No significant changes visible		
South:	Appears to be developed with the current commercial structure and parking areas on the central and western sections across Saturn Street		
West:	Appears to be developed with the current commercial structure		

Date:	2005	Scale:	1"=500'
Subject Property:	No significant changes visible		
North:	Appears to be developed with the second current water tank on the eastern section		
Northeast:	No significant changes visible		
East:	No significant changes visible		
South:	No significant changes visible		
West:	No significant changes visible		

Date:	2009, 2010, 2012, 2014, 2016, 2018, 2021	Scale:	1"=500'
Subject Property:	No significant changes visible		
North:	No significant changes visible		
Northeast:	No significant changes visible		
East:	No significant changes visible		
South:	Appears to be developed with the current commercial structure on the eastern section across Saturn Street		

Date:	2009, 2010, 2012, 2014, 2016, 2018, 2021	Scale:	1"=500'
West:	No significant changes visible		

Copies of select aerial photographs are included in Appendix B of this report.

3.2 Fire Insurance Maps

Partner reviewed the collection of Fire insurance maps (FIMS) from ERIS. FIM coverage was not available for the subject property.

A copy of the no coverage letter is included in Appendix B of this report.

3.3 City Directories

Partner reviewed historical city directories obtained from ERIS for past names and businesses that were listed for the subject property and adjoining properties. The findings are tabulated below:

City Directory Search for 1977 Saturn St (Subject Property)	
Year(s)	**Occupant Listed**
1985	XXXX
2003	United California Bank
2008	Bank of the West
2011	Bank of the West
2016	Atm, F I S, Bank of the West

** XXXX= A phone number is present but is not registered to a tenant or is disconnected*

Based on the city directory review, no environmentally sensitive listings were identified for the subject property address.

City Directory Search for 2000 Clover Dr (Adjoining Property)	
Year(s)	**Occupant Listed**
1963	Baker Ernest C
1970	Menges Roger C
1972	Menges Roger
1975	Officer Ronald
1979	Okazaki Mas
1985	Okazaki Mas
1990	Okazaki Mas
1995 96	Okazaki Mas
2000 01	Okazaki Ben, Okazaki Mas
2003	Mas Okazaki
2008	Ben Okazaki, Mas Okazaki
2016	Mas Okazaki, Catalina Kamimura, Benjamin Okazaki
2020	Benjamin Okazaki, Catalina Kamimura
2022	Benjamin Okazaki
City Directory Search for 1980 Saturn St (Adjoining Property)	
Year(s)	**Occupant Listed**

1990	Dataserv Cmpta Mntc
1995 96	XXXX
2000 01	XXXX
2008	Bank One Uboc Primary, Union Bank California Na, Eads Telecom North America, Investment Development Svcs
2016	Union Bank, Union Bank Atm
2020	Union Bank
2022	Union Bank
City Directory Search for 2001 Saturn St (Adjoining Property)	
Year(s)	**Occupant Listed**
2000 01	Tyler Trafficante Inc

** XXXX= A phone number is present but is not registered to a tenant or is disconnected*

Based on the city directory review, no environmentally sensitive listings were identified for the adjoining property addresses.

Copies of reviewed city directories are included in Appendix B of this report.

3.4 Historical Topographic Maps

Partner reviewed historical topographic maps obtained from ERIS. The following inferred uses of the subject property and adjoining properties interpreted from topographic maps in Appendix B and are tabulated below:

Date:	*1894, 1896, 1900, 1924*
Subject Property:	Depicted as undeveloped land
North:	Depicted as undeveloped land
Northeast:	Depicted as undeveloped land
East:	Depicted as undeveloped land
South:	Depicted as undeveloped land
West:	Depicted as undeveloped land

Date:	*1926, 1953*
Subject Property:	Depicted with a narrow wash on the southern section
North:	No significant changes depicted
Northeast:	Depicted with a narrow wash on the central section
East:	No significant changes depicted
South:	No significant changes depicted
West:	Depicted with roads

Date:	1966, 1972, 1981, 1991, 1994
Subject Property:	No significant changes depicted
North:	Depicted with a water tank on the central section and shaded to depict urban development on the western section
Northeast:	Previously depicted narrow wash is no longer depicted
East:	No significant changes depicted
South:	No significant changes depicted
West:	Shaded to depict urban development and depicted as developed with a commercial building on the southern section by 1991

Date:	2015, 2018, 2022
Subject Property:	Improvements, with the exception of roadways and landmark features, are not depicted
North:	Improvements, with the exception of roadways and landmark features, are not depicted
Northeast:	Improvements, with the exception of roadways and landmark features, are not depicted
East:	Improvements, with the exception of roadways and landmark features, are not depicted
South:	Improvements, with the exception of roadways and landmark features, are not depicted
West:	Improvements, with the exception of roadways and landmark features, are not depicted

Copies of reviewed topographic maps are included in Appendix B of this report.

4.0 REGULATORY RECORDS REVIEW

4.1 Regulatory Agencies

State Department

Regulatory Agency Data	
Name of Agency:	California Environmental Protection Agency (CalEPA)
Point of Contact:	https://siteportal.calepa.ca.gov/nsite/map/help
Agency Address:	1001 I Street, Sacramento, California 95814
Agency Phone Number:	(916) 323-2514
Date of Contact:	April 8, 2024
Method of Communication:	Online Research
Summary of Communication: The CalEPA Regulated Site Portal is a database and interactive map, which combines information from multiple state and federal data sources. The database provides an overview of regulated equipment, materials and activities for each site, such as underground and aboveground storage tanks, hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and/or toxic materials. The subject property is not identified on the CalEPA Regulated Site Portal as a regulated site.	

Health Department

Regulatory Agency Data	
Name of Agency:	Los Angeles County Public Health Investigation (LACPHI)
Point of Contact:	http://publichealth.lacounty.gov/phi/
Agency Address:	5555 Ferguson Drive, Commerce, California 90022
Agency Phone Number:	(323) 890-7806
Date of Contact:	April 8, 2024
Method of Communication:	Email
Summary of Communication: No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the LACPHI.	

Fire Department

Regulatory Agency Data	
Name of Agency:	Los Angeles County Fire Department (LACFD)
Point of Contact:	https://www.fire.lacounty.gov/hhmd/public-records-requests/
Agency Address:	1320 North Eastern Avenue, Los Angeles, California 90063
Agency Phone Number:	(323) 267-7217
Date of Contact:	April 8, 2024
Method of Communication:	Online Request Form
Summary of Communication: According to a search of available information, the subject property, identified as 1977 Saturn at 1977 Saturn Street, is listed on a CUPA Inactive Facility Inventory List under Facility ID Number FA0024090, CERS ID Number 10268983, and PE Numbers 7124, 1001, and 3002. The reviewed document on file with the LACFD, in association with 1977 Saturn, was an Inspection Report summarizing an inspection	

conducted on July 1, 2015. According to notes indicated in the report, Bank of the West, moved from the subject property in 2015 and no hazardous waste was observed to be left at the building premises. In addition, hazardous material and hazardous program elements associated with Bank of the West were reported to be inactivated.

Building Department

Regulatory Agency Data	
Name of Agency:	City of Monterey Park Community Development Department-Building and Safety Division / City of Monterey Park - City Clerk
Point of Contact:	https://aca-prod.accela.com/MONTEREYPARK/Default.aspx
Agency Address:	320 West Newmark Avenue, Monterey Park, California 91754
Agency Phone Number:	(626) 307-1300
Date of Contact:	April 8, 2024
Method of Communication:	Online Research
Summary of Communication: Records were available for review, as further discussed in the following table.	

Building Records Reviewed for 1977 Saturn Street (Subject Property)		
Year(s)	**Owner/Applicant**	**Description**
1979	Lloyds Bank California	New construction of an office building
1980	Lloyds Bank California	New construction of an office building
1980	Lloyds Bank	Installation of sprinklers above a fuel oil line
1980	Lloyds Bank of California	Installation of a sewer connection
1982	Lloyds Bank	Installation of interior partition walls for a micro-film photo laboratory
1983	Lloyds Bank California	Wall relocation and building alteration work
1984	Lloyds Bank	Interior partitions and second floor office wall extensions
1986	Sanwa Bank of California	Office rearrangement and installation of non-bearing partitions
1987	Sanwa Bank	Remodeling of interior walls
1987	Sanwa Bank California	Installation of a 1,500-gallon grease interceptor
1988	Sanwa Bank	Installation of one outlet for a commercial grease interceptor
1991	Sanwa Bank California	New construction of a 4,000-square foot utility building
1993	Sanwa Bank	Installation of nonbearing partitions
1994	Sanwa Bank of California	Rooftop structural reinforcement for seismic
1995	Sanwa Bank	Demolition and construction of non-bearing partitions
2004	Sanwa Bank	Reroof work
2007	Sanwa Bank	Replacement of diesel lines for a generator
2012	1977 Saturn, LLC	205,628-square foot administrative office, Occupancy Group B, Construction Type I-A
2018	1977 Saturn, LLC	Interior demolition
2018	1977 Saturn, LLC	Interior demolition
2020	1977 Saturn, LLC	Generator replacement

2021	1977 Saturn, LLC	Interior demolition
2021	1977 Saturn, LLC	Interior demolition

Building Records Reviewed for 2001 Saturn Street (Adjoining Property)		
Year(s)	**Owner/Applicant**	**Description**
1977	Not Applicable	Install fire sprinklers
1977	LA Stewart Developers	Plumbing permit
1977	Western Electric	Electrical permit
1977	JA Stewart Con	Electrical permit
1977	JA Stewart Development Co	HVAC installation
1977	Not Applicable	Install racks
1978	Not Applicable	Install flagpole
1998	Near Cal Corp	Structural repairs per water damage
2004	Union Bank of California	Demolish interior partitions and ceiling
2004	Near Cal Corp	Interior alterations
2004	Near Cal Corp	Electrical related to addition
2004	Near Cal Corp	Mechanical related to addition
2004	Near Cal Corp	Plumbing related to addition
2004	Near Cal Corp	Temporary power pole
2004	Near Cal Corp	Office tenant improvements
2005	Union Bank of California	Certificate of occupancy for financial institution
2005	Near Cal Corp	Interior tenant improvements
2005	Near Cal Corp	Mechanical for office interior improvements
2005	Near Cal Corp	New storage building
2005	Near Cal Corp	Temporary power pole
2005	Near Cal Corp	Mechanical improvements
2005	Near Cal Corp	Electrical alterations for new UPS system
2005	Near Cal Corp	Mechanical improvements for first floor
2006	Near Cal Corp	Interior tenant improvements
2006	Union Bank of California	New non-bearing wall
2007	Union Bank of California	Relocate office to new location
2023	Like Dreams	Square footage addition and tenant improvements

Planning Department

Regulatory Agency Data	
Name of Agency:	City of Monterey Park Community Development Department-Planning Division
Point of Contact:	https://www.montereypark.ca.gov/543/Zoning-Information---Development-Standard
Agency Address:	320 West Newmark Avenue, Monterey Park, California 91754
Agency Phone Number:	(626) 307-1315
Date of Contact:	April 8, 2024
Method of Communication:	Online Research
Summary of Communication: According to reviewed online documents, the subject property is zoned as "Office Professional (O-P Voter Enacted)" with Innovation/Technology land use designation for McCaslin Business Park development by the City of Monterey Park	

Oil & Gas Exploration

Regulatory Agency Data	
Name of Agency:	California Geologic Energy Management Division (CalGEM)
Point of Contact:	https://maps.conservation.ca.gov/doggr/wellfinder/#/-118.94276/37.10257/6
Agency Address:	715 P Street, MS 1900, Sacramento, California 95814
Agency Phone Number:	(916) 322-1080
Date of Contact:	April 8, 2024
Method of Communication:	Online Research
Summary of Communication: According to available information, one dry hole (Wellbore Number 040372012-00) was installed on the southwestern portion of the subject property. A Report of Well Abandonment prepared by CalGEM and dated August 9, 1967 was available for review. According to the report, the dry hole was installed to a total depth of 7,920 feet and was not used to produce oil or gas. Furthermore, on July 20, 1967, the dry hole was plugged to a depth of 3,550 feet and abandoned. CalGEM indicated that their review of associated reports and records determined that all requirements relative to plugging and abandonment of the well, removal of the well equipment and junk, and filling of the well records were fulfilled. As such, the plugged dry hole is not expected to represent a significant environmental concern. The subject property is not mapped within the boundary of a designated oil field.	

Assessor's Office

Regulatory Agency Data	
Name of Agency:	Los Angeles County Office of the Assessor (LACA)
Point of Contact:	https://assessor.lacounty.gov/
Agency Address:	500 West Temple Street, Los Angeles, California 90012
Agency Phone Number:	(916) 322-1080
Date of Contact:	April 8, 2024
Method of Communication:	Online Research
Summary of Communication:	

According to records reviewed, the subject property is identified by Assessor Parcel Number (APN) 5265-026-054. The current building was constructed in 1979 and totals approximately 205,628 square feet. No additional information was provided by the agency.

Air Pollution Control Agency

Regulatory Agency Data	
Name of Agency:	South Coast Air Quality Management District (AQMD)
Point of Contact:	http://www.aqmd.gov/nav/FIND
Agency Address:	21865 Copley Drive, Diamond Bar, California 91765
Agency Phone Number:	(909) 396-2000
Date of Contact:	April 8, 2024
Method of Communication:	Online Research

Summary of Communication:

According to a search of available information, the subject property, identified as Bank of the West, at 1977 Saturn Street, was recorded under Facility ID Number 63620. Although the status of the facility is indicated as "Active," observations made during Partner's site reconnaissance indicate that Bank of the West no longer occupies the subject property; therefore, the status is likely incorrect. Under the recorded Facility ID Number, the subject property was issued Permits to Operate (PTOs) for various equipment:

- On March 1, 1989, Sanwa Bank California (currently known as Bank of the West) was issued PTOs for two 10,000-gallon, diesel USTs (Permit Numbers: D06057 and D06058; Permit Statuses: Inactive) and one natural gas boiler (Permit Number: D06059; Permit Status: Inactive).
- On May 22, 1989, Sanwa Bank California was issued PTOs for two diesel-fueled emergency electrical generators (Permit Numbers: D07828 and D07831; Permit Status: Inactive).
- On September 17, 1990, Bank of the West was issued a PTO for a natural gas charbroiler (Permit Number: D27227; Permit Status: Inactive).
- On May 3, 1991, Bank of the West was issued a PTO for a 2,000-gallon, diesel-fuel UST (Permit Number: D38071; Permit Status: Inactive).
- On August 6, 1992, Bank of the West was issued PTOs for three diesel-fueled emergency electrical generators (Permit Numbers: D59892, D59893, and D59829; Permit Statuses: Inactive).
- On January 1, 2001, Bank of the West was issued PTOs for three diesel-fueled emergency electrical generators (Permit Numbers D5982, D59892, and D59893; Permit Statuses: Unknown).
- In addition, on July 24, 2008, Bank of the West was issued a Notice to Comply (NTC) for failure to submit Rule 1415 registration for all refrigerant units greater than 50 pounds along with a work site filing fee by the appropriate deadline. The NTC was subsequently returned to compliance following re-evaluation on August 22, 2008.

Regional Water Quality Agency

Regulatory Agency Data	
Name of Agency:	State Water Resources Control Board (SWRCB)
Point of Contact:	https://geotracker.waterboards.ca.gov/
Agency Address:	1001 I Street, Sacramento, California 95814
Agency Phone Number:	(213) 576-6600
Date of Contact:	April 8, 2024
Method of Communication:	Online Research

Summary of Communication:

According to available information, the subject property, identified as BRE CA Saturn, LLC at 1977 Saturn Street, is listed as a Non-Case Information site under the regulatory oversight of the Los Angeles Regional Water Quality Control Board (RWQCB) (Case Number T10000018576). According to information made available on the SWRCB GeoTracker database, along with review of regulatory database listings and previous reports, Case Number T10000018576 was previously recorded as a Leaking Underground Storage Tanks (LUST) Cleanup site in association with removal and assessment activities for three historical USTs installed on the subject property conducted under the oversight of the LACDPW in 2018. For further discussion of procedures completed with respect to the three historic USTs as well as additional assessment activities dating back to 2006, refer to Section 5.2.6. Pertinent information from documents made available on the SWRCB GeoTracker database under Case Number T10000018576 is summarized below:

- According to a letter prepared by the LACDPW and dated April 27, 2020, the LACDPW reviewed a Soil Sampling Results Related to UST System Removals report prepared by AEM and dated December 7, 2018, which is further discussed in Section 5.2.6. As the California RWQCB is the lead agency for the subject property mitigation, the LACDPW indicated that they have referred the matter to the said agency.
- According to a letter prepared by the Los Angeles RWQCB and dated June 28, 2022, based on their Los Angeles RWQCB's review of a submitted document from the LACDPW, the aforementioned Soil Sampling Results Related to UST System Removals report, the Los Angeles RWQCB determined that "residual concentrations of fuel constituents [in the areas of the three historic USTs] pose low threat to human health and the environment." Therefore, no further action was required at the time of the 2022 letter. Furthermore, the Los Angeles RWQCB indicated that subject property "data indicated that there may be residual concentrations of pollutants in soil at the subject property that could pose an unacceptable risk as a result of future construction/redevelopment activities, and/or change to a more sensitive land use from commercial use. Responsible parties, landowners, and contractors performing subsurface activities at the site should be prepared to manage properly to avoid threats to human health or the environment.'"

As of June 28, 2022, the status of the subject property Non-Case Information listing (Case Number T10000018576) is reported to be "Informational Item/Review Complete."

Department of Toxic Substances Control

Regulatory Agency Data	
Name of Agency:	California Department of Toxic Substances Control (DTSC)
Point of Contact:	http://www.envirostor.dtsc.ca.gov/public/
Agency Address:	1001 I Street, Sacramento, California 95814
Agency Phone Number:	(916) 323-7811
Date of Contact:	April 8, 2024
Method of Communication:	Online Research

Summary of Communication:

The EnviroStor database is the DTSC's data management system for tracking cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known contamination or sites where there may be reason to investigate further. No records were identified for the subject property address on the EnviroStor database.

The web based DTSC Hazardous Waste Tracking System (HWTS) was researched for hazardous waste manifest data submitted to the California DTSC. According to available information, the subject property was issued Environmental Protection Agency (EPA) Handler ID Numbers for the generation of regulated hazardous and non-hazardous waste. For further details, refer to Section 4.2.2.

County Department of Public Works

Regulatory Agency Data	
Name of Agency:	Los Angeles County Department of Public Works (LACDPW)
Point of Contact:	https://ladpw.org/epd/cleanla/OpenFileReview.aspx
Agency Address:	900 South Fremont Avenue, Alhambra, California 91803
Agency Phone Number:	(626) 458-5100
Date of Contact:	April 8, 2024
Method of Communication:	Online Research

Summary of Communication:

According to available information, five File Numbers associated with subject property are on file with the LACDPW. Notable information from reviewed available documents is summarized below:

- Bank of the West is recorded under File Numbers 006994-007311 and 006994-I07311. Records filed under File Number 006994-I07311, if any, were not readily available for review. Reviewed records on file under File Number 006994-007311 included various UST integrity and compliance documents prepared between 2009 and 2014 in association with three historical USTs installed on the subject property including Monitoring System Certifications, Secondary Containment Testing Report Forms, a UST Monitoring Plan, Owner Statements of Designated UST Operators, a Storage Tank Certificate of Insurance, UST Inspection Reports, and a 2014 Notice of Violation (NOV) pertaining to missing results from a secondary containment test.
- 1977 Saturn is recorded under File Number 006994-062151. Reviewed records included various UST integrity compliance documents prepared between 2016 and 2017 in association with three historical USTs installed on the subject property including UST Inspection Reports, a Monitoring System Certification, and a Secondary Containment Re-Test Report Form. In addition, NOVs were issued in 2016 and 2017 pertaining to missing test results and compliance documents and recommendations to perform compliance tests. Furthermore, a Closure Authorization for Hazardous Substance USTs was issued on October 25, 2018 to Equity Office

for permanent removal of on-site USTs.

- BRE CA Saturn, LLC is recorded under File Number 006994-065226. In addition to previously discussed documents in Section 4.1.5 and a 2018 Soil Sampling Results Related to UST System Removals report further discussed in Section 5.2.6., reviewed documents included an NOV issued in 2019 pertaining to submission of required documents and items to the California Environmental Report System (CERS).
- 1977 Saturn Street is recorded under File Number 006994-065372. On July 3, 2018, 1977 Saturn Street was issued an Industrial Waste Disposal Permit (Permit Number 865772) for a 1,500-gallon three-stage clarifier, also known as a grease interceptor, located on the southern exterior of the subject property building. In 2019, 1977 Saturn Street was issued a NOV pertaining to excessive oil/grease/solids and/or prohibited substances in the Industrial Waste Treatment Facility (IWTF) and failure to provide the most recent pumping records/manifest of the IWTF.

Copies of pertinent documents are included in Appendix B of this report.

4.2 Mapped Database Records Search

The regulatory database report provided by ERIS documents the listing of sites identified on federal, state, county, city, and tribal (when applicable) standard source environmental databases within the approximate minimum search distance (AMSD) specified by ASTM Practice E1527-21. The data from these sources are updated as these data are released and integrated into one database. The information contained in this report was compiled from publicly available sources.

The environmental database information is used to identify environmental concerns in connection with the subject property. The listings also serve to identify the known indications of the storage, use, generation, disposal, or release of hazardous substance at the subject property and the potential for contaminants to migrate onto the subject property from off-site sources in groundwater or soil in the form of liquids or vapor.

Using the ASTM definition of migration, Partner considers the migration of hazardous substances or petroleum products in any form onto the subject property during the evaluation of each site listed on the radius report, which includes solid, liquid, and vapor.

4.2.1 Regulatory Database Summary

The following table lists the sites as categorized by the regulatory database within the prescribed AMSD. The locations of the sites are plotted utilizing a geographic information system, which geocodes the site addresses. The accuracy of the geocoded locations is approximately +/-300 feet.

Database Report Data				
Database	**AMSD Radius (mile)**	**Listings Identified**		
		Subject Property	**Adjoining Properties**	**Surrounding Area Sites of Concern**
Federal NPL	1.00	N	N	N
Delisted NPL Site	0.50	N	N	N
Federal SEMS Site	0.50	N	N	N
Federal SEMS-ARCHIVE	0.50	N	N	N
Federal RCRA CORRACTS Facility	1.00	N	N	N
Federal RCRA TSDF Facility	0.50	N	N	N
Federal RCRA Generators Site (LQG, SQG, VSQG, CESQG)	Subject and Adjoining	**Y**	**Y**	N

Database Report Data				
Database	AMSD Radius (mile)	Listings Identified		
		Subject Property	Adjoining Properties	Surrounding Area Sites of Concern
Federal IC/EC Registries	Subject Property	N	N	N
Federal ERNS Site	Subject Property	N	N	N
State/Tribal Equivalent NPL	1.00	N	N	N
State/Tribal Equivalent CERCLIS	1.00	N	N	N
State/Tribal Landfill/Solid Waste Disposal Site	0.50	N	N	N
State/Tribal Leaking Storage Tank Site (LUST/LPST)	0.50	**Y**	N	N

State Brownfield Sites	0.50	N	N	N
Other Databases	Varies	**Y**	**Y**	N

4.2.2 Subject Property Listings

The subject property is identified as a CUPA LA COUNTY, DELISTED CTNK, DELISTED LST, DELISTED TNK, EMISSIONS, FINDS/FRS, GEOTRACKER, HAZ GEN, HIST MANIFEST, HMS LA, RCRA NON GEN, RCRA SQG, UST, and UST SWEEPS site in the regulatory database report, as discussed below:

Subject Property Database Listing	
Database:	CUPA LA COUNTY, DELISTED CTNK, HMS LA, UST
Site Name:	1977 Saturn; 1977 Saturn Street
Address:	1977 Saturn Street
Substance In-volved:	One, 2,000-gallon diesel UST Two 10,000-gallon diesel USTs
Years of Operation:	1980 (two, 10,000-gallon diesel USTs installed) to 2018 (two, 10,000-gallon diesel USTs removed) 1991 (one, 2,000-gallon diesel UST installed) to 2018 (one, 2,000-gallon die-sel UST removed)
Status:	Inactive

Discussion:	According to the CUPA LA COUNTY listing, 1977 Saturn is listed under Facility ID Number FA0024090, CERS ID Number 10268983, and PE Numbers 1001, 7124, and 3002 as an inactive CUPA program facility that is out of business and/or no longer regulated by the HHMD of the LACoFD. For further discussion of a reviewed record on file with the LACoFD in association with this listing, refer to Section 4.1.3. The HMS LA listing indicates that 1977 Saturn/1977 Saturn Street is listed under Site Number 006994 in the LACDPW Hazardous Materials System (HMS) Database. 1977 Saturn/1977 Saturn Street is recorded under File Numbers 062151 and 065372 and was issued a UST Operating Permit (Permit Number: 000842830; Permit Status: Closed) and an Operating Industrial Waste Permit for discharge to the local sewer (Permit Number: 000895772; Permit Status: Equipment Permitted). For further discussion of reviewed records on file with the LACDPW in association with this listing, refer to Section 4.1.11. The DELISTED CTNK and UST listings indicate that 1977 Saturn is recorded under Site ID Number 10890 and Facility ID Number LACoFA0024090 on a list of AST and UST sites that were removed from the CalEPA Regulated Site Portal and was issued permits to operate three USTs. For further discussion of the historical use of the subject property as a banking data center, in conjunction with the operations of three formerly on-site USTs, and respective environmental concerns, refer to Sections 3.0, 4.1, and 5.2.6.

Subject Property Database Listing	
Database:	DELISTED TNK, EMISSIONS, FINDS/FRS, HAZ GEN, HIST MANIFEST, HMS LA, RCRA SQG, UST SWEEPS
Site Name:	Sanwa Bank; Sanwa Bank California; Bank of the West
Address	1977 Saturn Street
Substance Involved:	One, 2,000-gallon petroleum UST Two waste USTs (unknown capacity)
Years of Operation:	1989 to 2016 (hazardous waste generation)
Status:	Inactive
Discussion:	According to the two EMISSIONS listings, Sanwa Bank/Sanwa Bank California is listed under Facility ID Number 63620 and SIC Code 6021 (National Commercial Banks) on a list of criteria and toxic pollutant emissions data for facilities in California made available by the CalEPA - Air Resources Board (ARB). Recorded years for Criteria Data and Toxic Data ranged from 1990 to 1995; however, further details regarding types of quantities of pollutants emitted were not made available. The FINDS/FRS listing indicates that Bank of the West is listed as a facility subject to environmental regulations under Registry ID Number 110065977090 and the interest type of "state master." According to the HMS LA listing, Bank of the West is listed under Site Number 006994 in the LACDPW HMS Database. Bank of the West is recorded under File Numbers 007311 and I07311 and was issued a UST Operating Permit (Permit Number: 00005594T; Permit Status: Closed) and an Operating Industrial Waste Permit for discharge to the local sewer (Permit Number: 000009804; Permit Status: Closed). For further discussion of reviewed records on file with the LACDPW in association with this listing, refer to Section 4.1.11. According to the HAZ GEN, HIST MANIFEST, and RCRA SQG listings, coupled with information from the California DTSC HWTS database, Sanwa Bank California/Bank of

	the West was issued EPA Handler ID Number CAD982463895 to generate regulated hazardous waste from June 1989 to June 2016, when the issued EPA Handler ID Number expired. Reported quantities of waste generated ranged from 0.08-tons (2007) to 1.06-tons (1994). As of January 2023, there are no Compliance Monitoring and Enforcement (violation) records associated with the Sanwa Bank California/Bank of the West (EPA Handler ID Number CAD982463895). The DELISTED TNK and UST SWEEPS listings indicate that Sanwa Bank is recorded under Facility ID Number 7311 and CC Number A19-000-7311 on a list of storage tank sites that were removed by the SWRCB and was issued permits to operate three USTs. Although the UST SWEEPS listing indicates that two waste USTs are of unknown capacity, the features are likely in reference to the aforementioned two, 10,000-gallon diesel USTs associated with the UST listing for 1977 Saturn. For further discussion of the historical use of the subject property as a banking data center, in conjunction with the operations of three formerly on-site USTs, and respective environmental concerns, refer to Sections 3.0, 4.1, and 5.2.6.

Subject Property Database Listing	
Database:	FINDS/FRS
Site Name:	United CA Bank
Address	1977 Saturn Street
Substance Involved:	Not reported
Years of Operation:	Not reported
Status:	Inactive
Discussion:	The FINDS/FRS listing indicates that United CA Bank is listed as a facility subject to environmental regulations under Registry ID Number 110018947773 and the interest type of "small quantity generator and state master." For further discussion of the historical use of the subject property as a banking data center, in conjunction with the operations of three formerly on-site USTs, and respective environmental concerns, refer to Sections 3.0, 4.1, and 5.2.6.

Subject Property Database Listing	
Database:	FINDS/FRS, RCRA NON GEN
Site Name:	Equity Office
Address	1977 Saturn Street
Substance Involved:	Tank bottom waste
Years of Operation:	2018 to 2019 (non-hazardous waste generation)
Status:	Inactive
Discussion:	The FINDS/FRS listing indicates that Equity Office is listed as a facility subject to environmental regulations under Registry ID Number 110070439637 and the interest type of "other hazardous waste activities." According to the RCRA NON GEN listing, coupled with information from the California DTSC HWTS database, Equity Office was issued EPA Handler ID Number CAC002986628 to generate regulated non-hazardous waste from October 2018 to January 2019, when the issued EPA Handler ID Number expired. A 2018 Uniform Hazardous Waste Manifest listing made

	available on the DTSC HWTS database indicates that 4.17 tons of non-RCRA hazardous waste liquid (water with trace hydrocarbons) was removed from the subject property for disposal. As of January 2023, there are no Compliance Monitoring and Enforcement (violation) records associated with Equity Office (EPA Handler ID Numbers CAC002986628). Based on the observed and reported inactive status of the facility, limited duration of hazardous waste generation, and the nature of the generated waste, these listings are not expected to represent an environmental concern.

Subject Property Database Listing	
Database:	HAZ GEN, HMS LA
Site Name:	BRE CA Saturn, LLC; BRE CA Office Owner, LLC
Address	1977 Saturn Street
Substance Involved:	Tank bottom waste
Years of Operation:	2016 to 2017 (hazardous waste generation)
Status:	Inactive
Discussion:	According to the HAZ GEN listing, coupled with information from the California DTSC HWTS database, BRE CA Office Owner, LLC was issued EPA Handler ID Number CAC002886409 to generate regulated hazardous waste from November 2016 to February 2017, when the issued EPA Handler ID Number expired. A 2018 Uniform Hazardous Waste Manifest listing made available on the DTSC HWTS database indicates that 1.88-tons of non-RCRA hazardous waste liquid (water with trace hydrocarbons) was removed from the subject property for disposal. The HMS LA listing indicates that BRE CA Saturn, LLC is listed under Site Number 006994 in the LACDPW HMS Database. BRE CA Saturn, LLC is recorded under File Number 065226 and was issued a UST Operating Permit (Permit Number: 000892942; Permit Status: Equipment Removed). For further discussion of reviewed records on file with the LACDPW in association with this listing, refer to Section 4.1.11. For further discussion of the historical use of the subject property as a banking data center, in conjunction with the operations of three formerly on-site USTs, and respective environmental concerns, refer to Sections 3.0, 4.1, and 5.2.6.

Subject Property Database Listing	
Database:	GEOTRACKER, LUST
Site Name:	BRE CA Saturn, LLC
Address	1977 Saturn Street
Date of Release:	2018
Substance Released:	Gasoline
Media Impacted:	Soil
Date of Closure:	June 28, 2022
Responsible Party:	BRE CA Saturn, LLC
Status:	Closed
Discussion:	According to the GEOTRACKER listing the subject property, identified as BRE CA Saturn, LLC at 1977 Saturn Street, is listed as a Non-Case Information site under the regulatory

	oversight of the Los Angeles Regional Water Quality Control Board (RWQCB) (Case Number T10000018576). In association with historical operations, two 10,000-gallon, single-walled, fiberglass, diesel fuel USTs (Tanks 1 and 2) were installed at the subject property in 1980 and one, 2,000-gallon steel double-walled, fiberglass coated, diesel fuel UST (Tank 3) was installed in 1991. Case Number T10000018576 was previously recorded as a Leaking Underground Storage Tanks (LUST) Cleanup site in association with removal of the three historical USTs on the subject property conducted under the oversight of the LACDPW in 2018. The subject property subsequently underwent site assessment activities and, after a review of analytical results, the Los Angeles RWQCB opined that no further action was required for the UST areas. As of June 28, 2022 the status of the subject property is indicated to be "Informational Item/Review Complete." For further discussion of procedures completed with respect to the Non-Case Information listing (formerly a LUST Cleanup Site listing) and a timeline that summarizes overall assessment and remedial procedures performed on the subject property dating back to 2006, refer to Section 5.2.6.

4.2.3 Adjoining Property Listings

The adjoining properties were identified as CERS TANK, CUPA LA COUNTY, DELISTED TNK, EMISSIONS, FINDS/FRS, HAZ GEN, HAZNET, HIST MANIFEST, HMS LA, RCRA NON GEN, UST, UST SWEEPS, and/or DELISTED CTNK sites in the regulatory database report, as discussed below:

Adjoining Property Database Listing	
Property Name:	CITY OF MONTEREY PARK
Address:	1980 Clover Drive
Direction:	Northwest
Hydrological Gradient:	Cross-Gradient
Database Listing:	HAZ GEN
Substance Involved:	Unknown
Years of Operation:	Unknown
Status:	Inactive
Discussion:	According to DTSC, the property is identified as a handler of hazardous materials. This profile is currently inactive. Further, there are no reported releases associated with the property. Based on regulatory oversight, inactive status, and lack of reported release, this listing is not expected to represent a significant environmental concern.

Adjoining Property Database Listing	
Property Name:	UNION BANK/2001 Saturn St/2001 SATURN LLC
Address:	2001 Saturn Street
Direction:	West
Hydrological Gradient:	Cross/Down-Gradient
Database Listing:	CUPA LA COUNTY, DELISTED CTNK, FINDS/FRS, RCRA NON GEN

Substance Involved:	Unknown
Years of Operation:	Unknown
Status:	Active/inactive
Discussion:	According to the EPA's comprehensive information system, the property is identified as a verified non-generator of hazardous materials. However, LACFD identified the property as an active property under their CUPA program and CalEPA identified the property as formerly equipped with a UST. The property also appeared on the FRS database which provides 'pointers' to other pertinent databases. These listings are in reference to the previously discussed EPA and CalEPA listings. Further, there are no reported releases associated with the property. Based on regulatory oversight, presumed site inspections by LACFD, and lack of reported releases, these listings are not expected to represent a significant environmental concern.

Adjoining Property Database Listing	
Property Name:	T-MOBILE WEST SITE ID#IE04996A
Address:	1970 Saturn Street
Direction:	South
Hydrological Gradient:	Down-Gradient
Database Listing:	CUPA LA COUNTY
Substance Involved:	Unknown
Years of Operation:	Unknown
Status:	Inactive
Discussion:	According to LACFD, the property appeared on their CUPA program as an inactive facility. Based on the facility name, the property likely equipped with a telecommunications tower which are generally built with an associated diesel-powered generator. Additionally, the property is located hydrologically down-gradient from the subject property across Saturn Street. Further, there are no reported releases associated with the property. Based on regulatory oversight, presumed site inspections by LACFD, hydrology, location, and lack of reported releases, this listing is not expected to represent a significant environmental concern.

Adjoining Property Database Listing	
Property Name:	UNION BANK/UNION BANK OPERATIONS CENTER/UNION BANK (VOLK CENTER)/DANIEL ROSALES/CBRE AGENT FOR UNION BANK/JONES LANGE LASALLE/UNION BANK OF CALIFORNIA/1X UNION BANK
Address:	1980 Saturn Street
Direction:	South
Hydrological Gradient:	Down-Gradient
Database Listing:	CERS TANK, CUPA LA COUNTY, DELISTED TNK, EMISSIONS, FINDS/FRS, HAZ GEN, HAZNET, HIST MANIFEST, HMS LA, RCRA NON GEN, UST, UST SWEEPS

Substance Involved:	Diesel, hazardous wastes
Years of Operation:	1986-2022
Status:	Unknown
Discussion:	According to the EPA's comprehensive information system, the property is identified as a verified non-generator of hazardous materials. However, DTSC identified the property as a handler of hazardous substances. These profiles are currently inactive. The Air Resources Board (ARB) failed to identify any health risks in association with the property. CalEPA, SWRCB, and LACFD identified the property as being formerly equipped with a UST. As such, the property undergoes routine site inspections with regulatory oversight assigned to LACDPW. The most recently reported inspection took place in July 2023 and a violation was reported for failing to obtain a valid permit to operate. This violation appears to be administrative in nature. Additionally, the property is located hydrologically down-gradient from the subject property across Saturn Street. Further, there are no reported releases associated with the property. Based on regulatory oversight, routine site inspections, hydrology, location, and lack of reported releases, these listings are not expected to represent a significant environmental concern.

Based on the findings, vapor migration is not considered an environmental concern at this time.

4.2.4 Surrounding Area Listings of Concern to Subject Property

Based on various mitigating factors including relative distance from the subject property, inferred direction of groundwater flow, media affected, and/or regulatory status, the remaining sites listed within the specified search radius of the subject property which appeared on local, State, or Federally published databases that report releases of hazardous substances, are not expected to represent an environmental concern.

Based on the findings, vapor migration is not considered an environmental concern at this time.

4.2.5 Unplottable Listings

No unplottable listings are identified in the regulatory database report.

A copy of the regulatory database report is included in Appendix C of this report.

5.0 USER PROVIDED INFORMATION AND INTERVIEWS

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the *Brownfields Amendments*), the *User* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. The *User* should provide the following information to the *environmental professional*. Failure to provide this information could result in a determination that *all appropriate inquiries* is not complete. The *User* is asked to provide information or knowledge of the following:

- Review Title and Judicial Records for Environmental Liens and AULs
- Specialized Knowledge or Experience of the User
- Actual Knowledge of the User
- Reason for Significantly Lower Purchase Price
- Commonly Known or *Reasonably Ascertainable* information
- Degree of Obviousness
- Reason for Preparation of this Phase I ESA

Fulfillment of these user responsibilities is key to qualification for the identified defenses to CERCLA liability. Partner requested our Client to provide information to satisfy User Responsibilities as identified in Section 6 of the ASTM guidance.

Pursuant to ASTM Practice E1527-21, Partner requested the following site information from SDFC Monterey Park, LLC (User of this report).

User Responsibilities		
Item	**Provided By User**	**Not Provided By User**
AAI User Questionnaire		X
Title Records, Environmental Liens, and AULs		X
Specialized Knowledge		X
Actual Knowledge		X
Valuation Reduction for Environmental Issues		X
Identification of Key Site Manager	X	
Reason for Performing Phase 1 ESA	X	
Prior Environmental Reports	X	

5.1 Interviews

5.1.1 Interview with Owner

The owner of the subject property was not available to be interviewed at the time of the assessment.

5.1.2 Interview with Report User

Please refer to Section 5.2 below for information requested from the Report User. The information requested was not received prior to the issuance of this report. The lack of this information is not considered to represent a significant data gap.

5.1.3 *Interview with Key Site Manager*

Mr. Fernando Casillas, key site manager, indicated that they had no information pertaining to any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the subject property; any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the subject property; or any notices from a governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.

5.1.4 *Interviews with Past Owners, Operators and Occupants*

Interviews with past owners, operators, and occupants were not conducted since information regarding the potential for contamination at the subject property was obtained from other sources.

5.2 User Provided Information

5.2.1 *Title Records, Environmental Liens, and AULs*

Partner was not provided with title records or environmental lien and AUL information for review as part of this assessment.

5.2.2 *Specialized Knowledge*

No specialized knowledge of environmental conditions associated with the subject property was provided by the User at the time of the assessment.

5.2.3 *Actual Knowledge of the User*

No actual knowledge of any environmental lien or AULs encumbering the subject property or in connection with the subject property was provided by the User at the time of the assessment.

5.2.4 *Valuation Reduction for Environmental Issues*

No knowledge of valuation reductions associated with the subject property was provided by the User at the time of the assessment.

5.2.5 *Commonly Known or Reasonably Ascertainable Information*

The User did not provide information that is commonly known or reasonably ascertainable within the local community about the subject property at the time of the assessment.

5.2.6 *Previous Reports and Other Provided Documentation*

The following information was provided to Partner for review during the course of this assessment:

Phase I Environmental Site Assessment, Partner Engineering and Science, Inc (April 3, 2023)

Partner prepared this report on behalf of StratCap Global Data Center Group. The assessment was reportedly performed in accordance with ASTM Standard E1527-13. The assessment consisted of a site reconnaissance, interviews with knowledgeable personnel, review of historical information, and a review of federal, state, and local regulatory databases. Pertinent information contained in this report is summarized below:

- At the time of the 2023 assessment, the subject property was unoccupied.
- According to Partner's review of available historical sources, the subject property was formerly undeveloped land as early as 1894 and developed with the current structure in 1979. Tenants on the subject property have included Lloyds Bank (1979-1984), Sanwa Bank (1986-2007), United California Bank (2002), Union California Bank (2003), and Bank of the West (2008-2016).

- According to available regulatory files and available documents, the subject property, identified as BRE CA Saturn, LLC at 1977 Saturn Street, is listed as a Non-Case Information site under the regulatory oversight of the Los Angeles Regional Water Quality Control Board (RWQCB) (Case Number T10000018576). According to information made available on the State Water Resources Control Board (SWRCB) GeoTracker database, along with review of regulatory database listings and previous environmental reports, Case Number T10000018576 was previously recorded as a Leaking Underground Storage Tanks (LUST) Cleanup site in association with removal and assessment activities, conducted under the oversight of the Los Angeles County Department of Public Works (LACDPW), for three historical underground storage tanks (USTs) installed on the subject property. According to available regulatory records, building records, and previous reports two 10,000-gallon, single-walled, fiberglass, diesel fuel USTs (Tanks 1 and 2) were installed on the northern exterior of the subject property building in 1980 and one, 2,500-gallon steel double-walled, fiberglass coated, diesel fuel UST (Tank 3) was installed on the western exterior of the generator building located on the northern portion of the subject property in 1991. The three USTs operated to supply an on-site emergency generator system associated with former tenants of the subject property. According to a Soil Sampling Results Related to UST System Removals report prepared by AEM and dated December 7, 2018, upon removal of the USTs in 2018, soil samples and groundwater samples were collected and analyzed for total petroleum hydrocarbons as diesel (TPH-d), benzene, toluene, ethylbenzene, and xylenes (BTEX), and fuel oxygenates in accordance with modified Environmental Protection Agency (EPA) method no. 8015 (for TPH-d) and EPA method no. 5035/8260B (for BTEX and fuel oxygenates). Two detections of TPH-d were reported in a sample collected from beneath the piping system (15.2 milligrams per kilogram [mg/kg]) and at 10 feet bgs in the sidewall of the Tank 3 tank pit (10.5 mg/kg). BTEX and fuel oxygenates were not detected above their respective laboratory method reporting limits in any of the soil or groundwater samples and TPH-d was not detected above the laboratory method reporting limit in either of the groundwater samples. On April 27, 2020, the LADCPW issued a letter to the RWQCB that indicated their review of the 2018 Soil Sampling Results Related to UST System Removals report and referral of the matter to the RWQCB for further action. According to a letter prepared by the Los Angeles RWQCB and dated June 28, 2022, based on their review of the documentation, the Los Angeles RWQCB determined that “residual concentrations of fuel constituents [in the areas of the three historic USTs] pose low threat to human health and the environment.” Therefore, no further action was required. Furthermore, the Los Angeles RWQCB indicated that subject property “data indicated that there may be residual concentrations of pollutants in soil at the subject property that could pose an unacceptable risk as a result of future construction/redevelopment activities, and/or change to a more sensitive land use from commercial use. Responsible parties, landowners, and contractors performing subsurface activities at the site should be prepared to manage properly to avoid threats to human health or the environment.” Based on the regulatory closure, reported removal of the identified USTs, completion of assessment and remedial activities, and indicated analytical results meeting the applicable regulatory standards for commercial use, the historical USTs and closed LUST case are considered a CREC.

- Partner reviewed a previous Phase I Environmental Site Assessment report for the subject property prepared by Northgate Environmental Management (Northgate) and dated March 31, 2022. Northgate reviewed previous reports for the subject property provided by EQ Office or obtained from the agency file reviews as summarized below:

    - *Phase I Environmental Site Assessment,* prepared by Bureau Veritas North America, Inc. (BVNAI), dated June 18, 2007
        - At the time of the 2007 assessment, the subject property was occupied by a bank data center that included a cafeteria with a kitchen on Level C.

- According to the BVNAI report, on August 18, 1988, the subject property was issued an industrial waste disposal permit for the operation of a 1,500-gallon grease interceptor likely associated with the former kitchen.
- During the site reconnaissance, BVNAI noted the presence of a floor drain that was reportedly closed in 1998 by the LADPW and a trench and sump pump that were reportedly installed in 1993 at the kitchen area on Level C.
- BVNAI indicated that, in October 1989, a survey for asbestos-containing materials (ACMs) was conducted at the subject property which consisted of the visual inspection of accessible areas, construction material sampling, and air monitoring. ACMs were reported to be detected in samples of pipe run insulation (east roof hot water heater room), floor tile mastic (print shop), and roofing mastic. An Operations and Maintenance Program was noted to be in place for the subject property.
- BVNAI identified the presence of three USTs (two, 10,000-gallon diesel USTs and one, 2,000-gallon diesel UST) at the subject property as a REC and recommended soil sampling in the vicinity of the USTs.

- *Limited Subsurface Investigation Report for Two 10,000-Gallon Diesel USTs at 1977 Saturn Street, Monterey Park, California,* prepared by BVNAI), dated June 26, 2007
  - The purpose of the Limited Subsurface Investigation was to assess potential subsurface impacts in the area of two of three identified USTs outlined in the 2007 BVNAI Phase I ESA.
  - Subsurface investigation activities included a geophysical survey, advancement of five soil borings to 18 feet bgs, and soil sample collection. Due to refusal encountered at 8 feet bgs at one location, only four borings were advanced at the corners of the UST area. A map was not provided to indicate the location of the borings relative to the USTs or the subject property.
  - Diesel staining was observed at a depth of approximately 14 feet bgs in one boring (BVSB-1). In addition, according to the Chief Engineer of the subject property at the time of the investigation, Mr. Joe Robelo, in 1991, approximately five gallons of diesel were released in the area of boring BVSB-1 during a piping re-modification project. Mr. Robelo indicated that the contractor cleaned up the release and no further information was available.
  - Soil samples were collected from each of the four borings at approximately 17.5 to 18 feet bgs and an additional sample was collected at a depth of 14.5 to 15 feet bgs from boring BVSB-1. Concentrations of TPH-d were reported in the two samples collected at depths of 14.5 to 15 feet bgs and 17.5 to 18 feet bgs in boring BVSB-1 at concentrations of 658 and 238 mg/kg, respectively.
- *Phase I Environmental Site Assessment Report,* prepared by Leighton Consulting, Inc. (LCI), dated December 10, 2014
  - At the time of the 2014 assessment, the subject property was occupied by a banking operations and office center.
  - The following notable observations were made during LCI's site reconnaissance:
    - A utility building on the northern portion of the subject property, constructed in 1991, housed a generator room with three 55-gallon aboveground storage tanks and a 2,000-gallon diesel UST.

        - LCI observed 55-gallon drum-sized containers for the storage of compressed oil, oil pit sludge and water, waste diesel/water mix, and chemicals for roof-level cooling equipment located in the generator room, Level A storage room, and on the roof.
    - According to the LCI report, in 2014, a subsurface environmental assessment was conducted on the subject property by the LACDPW to assess potential releases associated with the on-site USTs. The assessment reportedly did not identify any significant soil staining and no evidence suggesting a fuel release from the USTs was reported. As such, the LACDPW concluded that the subject property was not impacted in the areas assessed and no further assessment was recommended.
    - LIC identified one plugged and abandoned oil well (API 03720192) to potentially be located on the subject property or possibly off-site to the south as the precise location could not be determined. The well was reportedly drilled to a total depth of 7,920 feet bgs and was abandoned shortly after in 1967.
        - Further research conducted by Northgate as part of the 2022 Phase I ESA indicated that the feature is a plugged and abandoned dry hole that did not produce oil or gas located on the subject property.
    - LIC did not identify any RECs associated with the subject property; however, their report identified the following environmental conditions of potential concern and provided the associated recommendations:
        - The potential presence of one plugged and abandoned oil well located on the southwestern portion of the subject property was identified as a part of the assessment. LCI recommended direct field investigation to assess the location of the former oil well prior to new construction in this portion of the subject property. If an oil well is identified, LCI noted that the Division of Oil, Gas, and Geothermal Resources (presently identified as CalGEM) should be contacted to evaluate requirements for investigation and possible re-abandonment to current regulatory standards before any improvements commence at the Site.
        - The presence of three diesel USTs at the subject property for the operation of a backup generator system were identified as a part of the assessment. LCI recommended that if the USTs are not going to be used for proposed future operations that they be properly removed according to applicable regulatory guidelines with observation for evidence of releases beneath the tanks and piping.
        - A small on-site print shop and photo room with an industrial waste permit to discharge waste to the sewer were identified as a part of the assessment. No inappropriate discharge or leaks were identified; however, LCI recommended that observations for evidence of releases beneath the sewer lines be conducted if the building and associated utilities are demolished.
        - ACMs, (lead-based paint) LBP, and universal waste were reported to be located within the on-site structures. The locations, estimated quantities, and recommendations for their handling if disturbed during renovation or demolition activities are noted to be reported under a separate cover that was not made available to Northgate.
- *Observation of Limited Subsurface Investigation Activities,* prepared by URS, dated December 11, 2014

- URS prepared a letter summary of their observations of a limited subsurface investigation conducted by the LACDPW, which appears to be the investigation referenced in the LCI Phase I ESA above, dated December 11, 2014.
- On October 4 and 5, 2014, three borings were advanced to 40 feet bgs. Four borings were originally proposed to a total depth of 50 feet bgs; however, pea gravel was encountered in one boring (B-3). As such, the LACDPW decided to not advance boring B-3 to avoid impacting the integrity of the overlying surface parking lot. The total depth of the borings was not extended to the originally proposed 50 feet bgs as no field evidence of impacts were observed through 40 feet bgs.
- URS collected six split samples concurrent with the LACDPW investigation. Soil samples were collected at depths of 15 and 25 feet bgs from two borings (B-1 and B-2) and at depths of 10 and 20 feet bgs from the third boring (B-4). The soil samples were selected based on the judgement of an associated field geologist and were generally determined to be below the depths of the tank bottoms. URS noted that the LACDPW collected eight soil samples from borings B-1 and B-4 and seven soil samples from boring B-2.
- Soil samples were analyzed for TPH-d and VOCs and no VOCs or TPH-d were reported above their laboratory method reporting limits in any of the six soil samples collected for analysis by URS.
- Northgate noted that a copy of the laboratory analytical report for collected samples was provided as an appendix to the summary letter. A review of the analytical report indicated that no VOCs or TPH-d were reported above the laboratory method reporting limits in any of the 23 soil samples collected for analysis by LACDPW.

- *Soil Sampling Results Related to UST System Removals,* prepared by ALTA EM, Inc. (ALTA), dated December 7, 2018
  - ALTA prepared this report summarizing the results of tank system removals and associated soil sampling activities conducted at the subject property in 2018.
  - Details of the removed USTs were reported to be two, 10,000-gallon diesel fuel USTs (Tank 1 and 2) adjoining to one another and one, 2,500-gallon diesel fuel UST (Tank 3) located approximately 140 feet east of the larger tanks. All three tanks were used to supply emergency generators and were reported to be buried 3 to 4 feet bgs.
  - On November 8, 2018, soil samples (PS1 To PS13) were collected along the fuel product lines at depths ranging from 3.5 to 5 feet bgs and at least 2 feet below the removed lines. The tank pit containing Tanks 1 and 2 contained groundwater at approximately 11.5 feet bgs and a larger concrete pad beneath the tanks at approximately 13.5 feet bgs. As a result, soil sampling could not be performed and representative samples (TPGW1 and TPGW2) were collected from the groundwater at this location.
    - The tank pit for Tank 3 also contained a concrete pad at the bottom of the tank pit at approximately 11.5 feet bgs, but no groundwater was present. As soil samples could not be collected due to the presence of the concrete pad, sidewall samples were collected just above the concrete pad. With the exception of one sampling location beneath the former piping at a depth of approximately 4 feet bgs where a slight hydrocarbon odor was observed, there were no other field indications of a release including odor or discoloration of the soil.

- The soil and groundwater samples were analyzed for TPH-d, benzene, toluene, ethylbenzene, and xylenes (BTEX), and fuel oxygenates in accordance with modified EPA method no. 8015 (for TPH-d) and EPA method no. 5035/8260B (for BTEX and fuel oxygenates).
- Two detections of TPH-d were reported in a sample collected at 4 feet bgs below the piping system (15.2 mg/kg) and at 10 feet bgs in the sidewall of the Tank 3 tank pit (10.5 mg/kg). BTEX, and fuel oxygenates were not detected above their respective laboratory method reporting limits in any of the soil or groundwater samples and TPH-d was not detected above the laboratory method reporting limit in either of the groundwater samples.
- Based on the field observations and laboratory data, ALTA opined that there was no evidence indicating a significant release of diesel fuel from the removed UST systems. As such, ALTA concluded that no further action is recommended and requested a no further action letter for the subject property on behalf of the responsible party.

- *Hazardous Substances Underground Storage Closure/Site Assessment Report, Closure Application No 905166,* prepared LACDPW, dated April 27, 2020

  On April 27, 2020, the LADCPW issued a letter to the RWQCB that indicated their review of the 2018 Soil Sampling Report and referral the matter to the RWQCB for further action. At the time of Northgate's 2022 assessment, the case was pending the RWQCB's review and response.

  Northgate identified the three historical USTs as a REC and, in the absence of a closure/no further action (NFA) letter from the RWQCB at the time of the assessment, Northgate recommended contacting the RWQCB if redevelopment work was planned in the areas of the USTs to ensure that the work is in compliance with their requirements. Based on Northgate's review of data provided in previous reports, Northgate opined that there was a reasonable expectation that the RWQCB will grant a non-case determination for the subject property. As such, no further investigation was recommended at the time of the 2022 assessment. Partner notes that NFA status was granted by the RWQCB in June 2022.

Partner identified the former USTs as a CREC and recommended no further investigation.

Copies of pertinent pages reviewed are included in Appendix B of this report.

6.0 SITE RECONNAISSANCE

The weather at the time of the site visit was overcast. Refer to Section 1.5 for limitations encountered during the field reconnaissance and Sections 2.1 and 2.2 for subject property operations. The table below provides the site assessment details:

Site Assessment Data	
Site Assessment Performed By:	Adrian Gutierrez
Site Assessment Conducted On:	April 12, 2024

The table below provides the subject property personnel interviewed during the field reconnaissance:

Site Visit Personnel for the Subject Property			
Name	**Title/Role**	**Contact Number**	**Site Walk* Yes/No**
Fernando Casillas	Building Engineer	Not Provided	Yes
* Accompanied Partner during the field reconnaissance activities and provided information pertaining to the current operations and maintenance of the subject property			

No potential environmental concerns were identified during the onsite reconnaissance.

6.1 General Site Characteristics

6.1.1 Solid Waste Disposal

Solid waste generated at the subject property is disposed of in commercial dumpsters located on the north side of the subject property. An independent solid waste disposal contractor, Athens Services, removes solid waste from the subject property. No evidence of illegal dumping of solid waste was observed during the Partner site reconnaissance.

6.1.2 Sewage Discharge and Disposal

Sanitary discharges on the subject property are directed into the municipal sanitary sewer system. The Monterey Park Public Works Department services the subject property vicinity. No wastewater treatment facilities were observed or reported on the subject property. No septic systems were observed or reported on the subject property.

6.1.3 Stormwater and Surface Water Drainage

Stormwater is removed from the subject property primarily by sheet flow action across the paved surfaces towards stormwater drains located throughout the subject property parking lot and in the public right of way as well as ground infiltration. No drywells were identified on the subject property.

6.1.4 Source of Heating and Cooling

Heating and cooling systems as well as domestic hot water equipment are fueled by electricity and natural gas provided by Southern California Edison (SCE) and Southern California Gas (SoCal Gas), respectively. The mechanical system is comprised of Partner observed two cooling towers and two chillers on the roof (one on each section) which serves as the onsite HVAC system. Hot water is provided by central natural gas boiler units.

6.1.5 Wells and Cisterns

No aboveground evidence of wells or cisterns was observed during the site reconnaissance. Refer to Sections 4.1 and 5.2.6 for discussion of former on-site monitoring wells and associated investigations.

6.1.6 Wastewater

Domestic wastewater generated at the subject property is disposed by means of the sanitary sewer system. No industrial processes are currently performed at the subject property.

6.1.7 Septic Systems

No septic systems were observed or reported on the subject property.

6.1.8 Additional Site Observations

No additional general site characteristics were observed during the site reconnaissance.

6.2 Potential Environmental Hazards

6.2.1 Hazardous Substances and Petroleum Products Used or Stored at the Site

Partner identified hazardous substances or petroleum products used, stored, and/or generated on the subject property as noted in the following table:

Hazardous Substances and/or Petroleum Products Noted Onsite						
Substance	**Container Type**	**Quantity/Size**	**Location**	**Nature of Use**	**Secondary Containment**	**Environmental Concern**
Chem-aqua	Buckets	Three buckets	Roof	HVAC system	No	No; according to onsite staff, the substance is used to treat the return water from the HVAC system.

The materials were found to be properly labeled and stored at the time of the assessment with no signs of leaks, stains, or spills. Secondary containment is not provided.

6.2.2 Aboveground & Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs)

Partner observed an area of patched asphalt on the northern exterior of the subject property building indicating the location of two of three former USTs (removed in 2018). In addition, Partner was shown the general area of the third former UST (removed in 2018) located on the eastern exterior of the northern generator building. For further discussion of the features, refer to Sections 4.1 and 5.2.6. Partner also observed one diesel AST within the Generator Room of the building located on the northern portion of subject property. No staining, leaks, or spills were noted within in the vicinity of the AST, and no releases have been reported to the California State Water Resources Control Board (SWRCB). Based on the observed conditions and lack of reported releases, the presence of the current and former ASTs is not expected to represent a significant environmental concern.

6.2.3 Evidence of Releases

No spills, stains, or other indications that a surficial release has occurred at the subject property were observed.

6.2.4 Polychlorinated Biphenyls (PCBs)

Older transformers and other electrical equipment could contain PCBs at a level that subjects them to regulation by the U.S. EPA. PCBs in electrical equipment are controlled by United States Environmental Protection Agency regulations 40 CFR, Part 761. Under the regulations, there are three categories into which electrical equipment can be classified: 1) Less than 50 parts per million (ppm) of PCBs – “Non-PCB;”

2) 50 ppm-500 ppm – “PCB-Contaminated;” and, 3) Greater than 500 ppm – “PCB-Containing.” The manufacture, process, or distribution in commerce or use of any PCB in any manner other than in a totally enclosed manner was prohibited after July 2, 1979.

Transformers and Hydraulic Equipment				
Type of Equipment	**Location**	**Number**	**PCB Containing**	**Concern**
Pad-Mounted Transformers	Utility/generator buildings	Several	Unlikely	No
Hydraulic Elevators	Elevator equipment room	One	Unlikely	No
Trash Compactor	Northwestern section of the subject property building	One	Unlikely	No
Dock Levelers	Loading dock on the northeastern section of the subject property building	Two	Unlikely	No

The on-site reconnaissance addressed indoor and outdoor transformers that may contain PCBs. Several pad-mounted transformers were observed on the subject property. The transformers are not labeled indicating PCB content. No staining or leakage was observed in the vicinity of the transformers. Based on the good condition of the equipment, the transformers are not considered an environmental concern.

Partner observed two dock levelers at the loading dock located on the northeastern section of the subject property building. No visual evidence of spills or releases of hydraulic oil were noted near the equipment. Based on the observed good conditions of the equipment, their presence is not expected to represent a significant environmental concern. One hydraulic elevator services the subject property building. Equipment with respect to the elevator is located in the Elevator Maintenance Room. According to the site escort, the elevator equipment is serviced by Otis Elevator Company. No visual evidence of spills or releases of hydraulic oil were noted near the equipment. Based on the observed good condition and regular maintenance of the elevator equipment, their presence is not expected to represent a significant environmental concern. Lastly, Partner observed a trash compacter at a loading dock located on the northwestern portion of the subject property building. The trash compactor was reported to not be in use due to the vacant status of the subject property. No visual evidence of spills or releases of hydraulic oil were noted near the equipment. Based on the good conditions observed and nature of the use, the presence of the trash compactor is not expected to represent an environmental concern.

6.2.5 Strong, Pungent or Noxious Odors

No strong, pungent or noxious odors were evident during the site reconnaissance.

6.2.6 Pools of Liquid

No pools of liquid were observed on the subject property during the site reconnaissance.

6.2.7 Drains, Sumps and Clarifiers

Partner observed the following drains, sumps, and/or clarifiers located on the subject property:

Drains, Sumps, and Clarifiers Observed Onsite				
Drain/Sump/Clarifier	**Number Observed**	**Location**	**Point of Discharge**	**Sealed/Bermed**
Drains	Several	Parking area and northern utility room	Municipal sewer system	N/A
Clarifier	One	Southern section	Municipal sewer system	N/A

Partner observed stormwater drains throughout the subject property parking lot. The features are solely associated with stormwater drainage within the subject property and no significant stains or evidence of improper discharge of hazardous materials or petroleum products were observed within the vicinity of the features. As such, the presence of these features is not expected to represent a significant environmental concern. Partner also observed floor drains throughout the subject property building. According to the site escort, the drains were associated with former kitchen operations conducted by a historical tenant of the subject property. The observed drains were reported to be connected to a subsurface three-stage clarifier, also referred to as a grease interceptor, located on the southern exterior of the subject property building. The clarifier was used to treat wastewater streams generated from the former kitchen operations. Based on the food grade nature of the clarifier, the presence of this feature is not expected to represent a significant environmental concern. Furthermore, Partner observed a floor drain within the Generator Room of a generator building located on the northern portion of subject property. No significant stains or evidence of improper discharge of hazardous materials or petroleum products were observed within the vicinity of the feature. As such, the presence of the floor drain is not expected to represent a significant environmental concern.

6.2.8 Pits, Ponds and Lagoons

No pits, ponds, or lagoons were observed on the subject property.

6.2.9 Stressed Vegetation

No stressed vegetation was observed on the subject property.

6.2.10 Additional Potential Environmental Hazards

No additional environmental hazards, including landfill activities or radiological hazards, were observed.

6.3 Non-ASTM Services

6.3.1 Asbestos-Containing Materials (ACMs)

Asbestos is the name given to a number of naturally occurring, fibrous silicate minerals mined for their useful properties such as thermal insulation, chemical and thermal stability, and high tensile strength. The Occupational Safety and Health Administration (OSHA) regulation 29 CFR 1926.1101 requires certain construction materials to be presumed to contain asbestos, for purposes of this regulation. All thermal system insulation (TSI), surfacing material, and asphalt/vinyl flooring that are present in a building that have not been appropriately tested are “presumed asbestos-containing material” (PACM).

The subject property buildings were constructed in 1979. Partner has conducted a limited, visual evaluation of accessible areas for the presence of suspect ACM at the subject property. The objective of this visual survey was to note the presence and condition of suspect ACM observed. Please refer to the table below for identified suspect ACM:

Suspect ACMs			
Suspect ACM	**Location**	**Friable Yes/No**	**Physical Condition**
Drywall Systems	Throughout Building Interior	No	Good
Ceiling Tiles	Throughout Building Interior	No	Fair to Good
Flooring	Throughout Building Interior	No	Fair to Good
Roofing Materials	Roof	No	Good

Prior to disturbance, Partner recommends a comprehensive asbestos survey of the property be completed to determine the presence, condition, friability and likely future condition of suspect or confirmed ACM. All

suspect materials must be handled as ACM according to local, state and federal regulations until the results of sampling and analysis indicate the material is a non-ACM. According to the US EPA, ACM that is intact and in good condition can, in general, be managed safely in-place under an Operations and Maintenance (O&M) Program until removal is dictated by renovation, demolition, or deteriorating material condition.

Partner was not provided building plans or specifications for review, which may have been useful in determining areas likely to have used ACM.

6.3.2 Lead-Based Paint (LBP)

Lead is a highly toxic metal that affects virtually every system of the body. LBP is defined as any paint, varnish, stain, or other applied coating that has 1 mg/cm2 (or 5,000 µg/g or 0.5% by weight) or more of lead. Congress passed the Residential Lead-Based Paint Hazard Reduction Act of 1992, also known as "Title X," to protect families from exposure to lead from paint, dust, and soil. Under Section 1017 of Title X, intact LBP on most walls and ceilings is not considered a "hazard," although the condition of the paint should be monitored and maintained to ensure that it does not become deteriorated. Further, Section 1018 of this law directed the Housing and Urban Development (HUD) and the US EPA to require the disclosure of known information on LBP and LBP hazards before the sale or lease of most housing built before 1978.

It is unlikely that LBP is present in buildings constructed after 1977. Therefore, due to the age of the subject property buildings, it is unlikely that LBP is present.

Actual material samples would need to be collected in order to determine if LBP is present.

6.3.3 Radon

Radon is a colorless, odorless, naturally occurring, radioactive, inert, gaseous element formed by radioactive decay of radium (Ra) atoms. The US EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three Radon Zones, according to the table below:

EPA Radon Zones		
EPA Zones	**Average Predicted Radon Levels**	**Potential**
Zone 1	Exceed 4.0 pCi/L	Highest
Zone 2	Between 2.0 and 4.0 pCi/L	Moderate
Zone 3	Less than 2.0 pCi/L	Low

It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the US EPA recommends site-specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures.

Review of the US EPA Map of Radon Zones places the subject property in Zone 2. Based upon the radon zone classification, radon is not considered an environmental concern.

6.3.4 Lead in Drinking Water

According to available information, a public water system operated by the Monterey Park Public Works Water Department serves the subject property vicinity. The sources of public water for the City of Monterey Park are groundwater from the Main San Gabriel Groundwater Basin (Main Basin) and water purchased from the San Gabriel Water Company, which also pumps groundwater from the Main Basin. No public supply wells were identified at the subject property of the adjoining properties. According to the 2022 Annual Water Quality Report, water supplied to the subject property is in compliance with all State and Federal regulations pertaining to drinking water standards, including lead and copper. Water sampling was not conducted to verify water quality.

6.3.5 Mold

Molds are microscopic organisms found virtually everywhere, indoors and outdoors. Mold will grow and multiply under the right conditions, needing only sufficient moisture (e.g.in the form of very high humidity, condensation, or water from a leaking pipe, etc.) and organic material (e.g., ceiling tile, drywall, paper, or natural fiber carpet padding).

Partner observed accessible, interior areas for the subject property buildings for significant evidence of mold growth with the exceptions detailed in Section 1.5 of this report; however, this assessment should not be used as a mold survey or inspection. Additionally, this limited assessment was not designed to assess all areas of potential mold growth that may be affected by mold growth on the subject property. Rather, it is intended to give the client an indication as to whether or not conspicuous (based on observed areas) mold growth is present at the subject property. This evaluation did not include a review of pipe chases, mechanical systems, or areas behind enclosed walls and ceilings.

No obvious indications of water damage or mold growth were observed during Partner's visual assessment.

6.3.6 Wetlands

The subject property does not appear to be a designated wetland area based on information obtained from the United States Fish and Wildlife Service; however, a comprehensive wetlands survey would be required in order to formally determine actual wetlands on the subject property. No settling ponds, lagoons, surface impoundments, wetlands or natural catch basins were observed at the subject property during this assessment.

6.4 Adjoining Property Reconnaissance

The adjoining property reconnaissance consisted of observing the adjoining properties from the subject property premises.

6.4.1 Hazardous Substances and Petroleum Products Used or Stored at the Site

No hazardous substances or petroleum products were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.2 ASTs/USTs for Hazardous Substances or Petroleum Products

No ASTs or USTs for hazardous substances/petroleum products were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.3 Evidence of Releases

No evidence of a release was observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.4 PCBs

No PCB containing materials were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.5 Strong, Pungent, or Noxious Odors

No strong, pungent, or noxious odors were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.6 Pools of Liquid

No pools of liquid were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.7 Drains, Sumps, and Clarifiers

No drains, sumps, or clarifiers were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.8 Pits, Ponds, and Lagoons

No pits, ponds, or lagoons were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.9 Stressed Vegetation

No stressed vegetation was observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.10 Additional Potential Environmental Hazards

No additional environmental hazards were observed on adjoining properties during the limited adjoining property reconnaissance.

7.0 VAPOR ENCROACHMENT CONDITIONS

Partner conducted a limited non-intrusive vapor screening on the subject property to identify, to the extent feasible, the potential for vapor encroachment conditions (VECs) in connection with the subject property. This included consideration of chemicals of concern (COC) that may migrate as vapors into the subsurface of the subject property as a result of contaminated soil and groundwater on or near the property.

This screening utilized readily available data sources previously discussed in this Phase I ESA that includes:

- the physical setting of the subject property (Section 2.4),
- standard historical sources for the subject property, adjoining, and surrounding area (Section 3.0),
- known or potentially contaminated sites as identified from information from regulatory agencies and sites on Federal, State, tribal and local databases (Section 4.0), and
- information from the site reconnaissance (Section 6.0) of the subject property and observations of the surrounding properties.

The results of our data collection, reconnaissance, and analysis are tabulated below:

Potential for Vapor Encroachment to Impact the Subject Property	
Area of Concern	***Likely or Known VEC to Subject Property***
Subject Property Existing Operations or Conditions (Sections 2.0 and 6.0)	None identified that impact the subject property.
Historical Uses of the Subject Property (Section 3.0)	None identified that impact the subject property.
Adjoining Property Operations or Existing Conditions (Sections 2.3 and 6.4)	None identified that impact the subject property.
Historical Uses of Adjoining Properties or Nearby Properties (Section 3.0)	None identified that impact the subject property.
Regulatory Review of sites identified on Federal, State, tribal and Local Environmental Databases which were located in the AMSD (Section 4.0)	As discussed in Sections 4.1 and 5.2.6, three USTs were removed from the subject property in 2018. BTEX and fuel oxygenates were not detected above their respective laboratory method reporting limits in any of the soil or groundwater samples and TPH-d was not detected above the laboratory method reporting limit in either of the groundwater samples. Residual concentrations of fuel constituents were allowed to remain in place in the area of the former USTs per the Los Angeles RWQCB NFA letter dated June 28, 2022. Based on the removal of the USTs, regulatory closure, soil sampling analytical results, and relatively impermeable surfaces covering the area of the residual soil impacts, a VEC is not suspected.

Based on the findings of the limited non-intrusive vapor screening, vapor intrusion is unlikely to be an issue of concern in connection with the existing structures on the subject property. As such, no further assessment is recommended.

8.0 FINDINGS AND CONCLUSIONS

Findings and Opinions

Recognized Environmental Condition

A recognized environmental condition (REC) refers to the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment.

- Partner did not identify any RECs during the course of this assessment.

Controlled Recognized Environmental Condition

A controlled recognized environmental condition (CREC) refers to a REC affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of required controls (for example, activity and use limitations or other property use limitations). The following was identified during the course of this assessment:

- According to available historical sources and previous reports, the subject property, identified as BRE CA Saturn, LLC at 1977 Saturn Street, is listed as a Non-Case Information site under the regulatory oversight of the Los Angeles Regional Water Quality Control Board (RWQCB) (Case Number T10000018576). According to information made available on the State Water Resources Control Board (SWRCB) GeoTracker database, along with review of regulatory database listings and previous environmental reports, Case Number T10000018576 was previously recorded as a Leaking Underground Storage Tanks (LUST) Cleanup site in association with removal and assessment activities, conducted under the oversight of the Los Angeles County Department of Public Works (LACDPW), for three historical underground storage tanks (USTs) installed on the subject property. According to available regulatory records, building records, and previous reports two 10,000-gallon, single-walled, fiberglass, diesel fuel USTs (Tanks 1 and 2) were installed on the northern exterior of the subject property building in 1980 and one, 2,500-gallon steel double-walled, fiberglass coated, diesel fuel UST (Tank 3) was installed on the western exterior of the generator building located on the northern portion of the subject property in 1991. The three USTs operated to supply an on-site emergency generator system associated with former tenants of the subject property.

  According to a Soil Sampling Results Related to UST System Removals report prepared by AEM and dated December 7, 2018, upon removal of the USTs in 2018, soil samples and groundwater samples were collected and analyzed for total petroleum hydrocarbons as diesel (TPH-d), benzene, toluene, ethylbenzene, and xylenes (BTEX), and fuel oxygenates in accordance with modified Environmental Protection Agency (EPA) method no. 8015 (for TPH-d) and EPA method no. 5035/8260B (for BTEX and fuel oxygenates). Two detections of TPH-d were reported in a sample collected from beneath the piping system (15.2 milligrams per kilogram [mg/kg]) and at 10 feet bgs in the sidewall of the Tank 3 tank pit (10.5 mg/kg). BTEX and fuel oxygenates were not detected above their respective laboratory method reporting limits in any of the soil or groundwater samples and TPH-d was not detected above the laboratory method reporting limit in either of the groundwater samples.

  On April 27, 2020, the LADCPW issued a letter to the RWQCB that indicated their review of the 2018 Soil Sampling Results Related to UST System Removals report and referral of the matter to the RWQCB for further action. According to a letter prepared by the Los Angeles RWQCB and

dated June 28, 2022, based on their review of the documentation, the Los Angeles RWQCB determined that "residual concentrations of fuel constituents in the areas of the three historic USTs pose low threat to human health and the environment." Therefore, no further action was required. Furthermore, the Los Angeles RWQCB indicated that subject property "data indicated that there may be residual concentrations of pollutants in soil at the subject property that could pose an unacceptable risk as a result of future construction/redevelopment activities, and/or change to a more sensitive land use from commercial use. Responsible parties, landowners, and contractors performing subsurface activities at the site should be prepared to manage properly to avoid threats to human health or the environment."

Based on the regulatory closure, reported removal of the identified USTs, completion of assessment and remedial activities, and indicated analytical results meeting the applicable regulatory standards for commercial use, the historical USTs and closed LUST case are considered a CREC and no further investigation appears warranted at this time.

Historical Recognized Environmental Condition

A historical recognized environmental condition (HREC) refers to a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations).

- Partner did not identify any HRECs during the course of this assessment.

Business Environmental Risk

A Business Environmental Risk (BER) is a risk which can have a material environmental or environmentally driven impact on the business associated with the current or planned use of commercial real estate, not necessarily related to those environmental issues required to be investigated in this practice. The following was identified during the course of this assessment:

- Due to the age of the subject property buildings, there is a potential that asbestos-containing material (ACM) are present. Readily visible suspect ACMs were observed in good condition. Should these materials be replaced, the identified suspect ACMs would need to be sampled to confirm the presence or absence of asbestos prior to any renovation or demolition activities to prevent potential exposure to workers and/or building occupants.

Significant Data Gaps

No significant data gaps affecting the ability of the Environmental Professional to identify a REC were encountered during this assessment.

Conclusions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-21 of 1977 Saturn Street in Monterey Park, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of RECs and HRECs in connection with the subject property; however, a CREC and BER were identified. Based on the conclusions of this assessment, Partner recommends the following:

- Partner recommends preparation of a Soil Management Plan to address potential soils with residual impacts remaining on the subject property during any future construction/redevelopment activities.

9.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Partner has performed a Phase I Environmental Site Assessment of the property located at 1977 Saturn Street in Monterey Park, Los Angeles County, California in conformance with the scope and limitations of the protocol and the limitations stated earlier in this report. Exceptions to or deletions from this protocol are discussed earlier in this report.

By signing below, Partner declares that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR §312. Partner has the specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the subject *property*. Partner has developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

RE: CITY DIRECTORY RESEARCH
1977 Saturn Street
MONTEREY PARK,CA 91755

Thank you for contacting ERIS for an City Directory Search for the site described above. Our staff has conducted a reverse listing City Directory search to determine prior occupants of the subject site and adjacent properties. We have provided the nearest addresses(s) when adjacent addresses are not listed. If we have searched a range of addresses, all addresses in that range found in the Directory are included.

Note: Reverse Listing Directories generally are focused on more highly developed areas. Newly developed areas may be covered in the more recent years, but the older directories will tend to cover only the "central" parts of the city. To complete the search, we have either utilized the ACPL, Library of Congress, State Archives, and/or a regional library or history center as well as multiple digitized directories. These do not claim to be a complete collection of all reverse listing city directories produced.

ERIS has made every effort to provide accurate and complete information but shall not be held liable for missing, incomplete or inaccurate information. To complete this search we used the general range(s) below to search for relevant findings. If you believe there are additional addresses or streets that require searching please contact us at 866-517-5204.

Search Criteria:
all of Clover Dr
1970-2075 of Fulton Ave
all of Iris Way
1900-2010 of S Orange Ave
all of Saturn St
Search Notes:

OVERALL INSPECTION COMMENTS

Consent Given By:
Jack Caffey (Security Officer)
Observed no significant violation on site. Bank of The West has moved out from this location since 06/30/2015.

Attention: Your facility may be subject to reinspection at any time to verify compliance. Failure to comply with the violations cited may result in reinspection fees, permit revocation, and/or administrative/civil/criminal penalties. Any time granted for correction of the violation(s) does not preclude any enforcement action by this Department or other agencies.

It is improper and illegal for any County officer, employee or inspector to solicit bribes, gifts, or gratuities in connection with performing their official duties. Improper solicitations include requests for anything of value such as cash, discounts, free services, paid travel or entertainment, or tangible items such as food or beverages. Any attempt by a County employee to solicit bribes, gifts or gratuities for any reason should be reported immediately to either the County manager responsible for supervising the employee or the Fraud hotline at (800) 544-6861 or www.lacountyfraud.org. YOU MAY REMAIN ANONYMOUS.

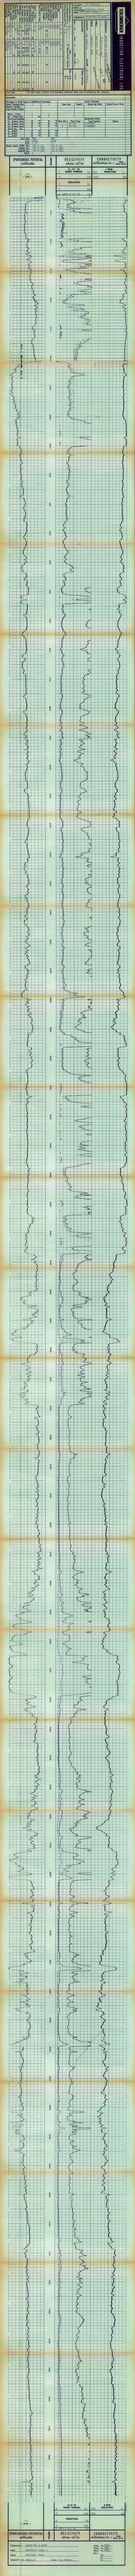
Dear: Adrian Gutierrez,

SUBJECT: 1977 Saturn St. Monterey Park, CA 91755

I, the undersigned, being the Custodian of Records, certify that a thorough search of our files, carried out under my direction and control, revealed no records as named in your request for records.

It is to be understood that this does not mean that records do not exist under another spelling, another name, or under another classification, but that with the information furnished to our office, and to the best of our knowledge, no such records exist in our files. Also, note that the DPH reserves the right to assert all applicable privileges/doctrines and exemptions.



If you have any questions, please contact me at (213) 288-7195.

Sincerely,

Tyease Davis

History of Oil or Gas Well

OPERATOR BRADFORD BISHOP, Operator (Los Angeles County) FIELD ----

Well No. "Monterey Park" 1, Sec. 35, T. 1 S, R. 12 W, S.B. B. & M.

Date August 2, 1967 Signed Bradford Bishop

209 Fair Oaks Ave., Suite 407
So. Pasadena, Calif. 91030 682-3674 Title Operator

(Address) (Telephone Number) (President, Secretary or Agent)

It is of the greatest importance to have a complete history of the well. Use this form to report a full account of all important operations during the drilling and testing of the well or during re-drilling, altering of casing, plugging, or abandonment with the dates thereof. Be sure to include such items as hole size, formation test details, amounts of cement used, top and bottom of plugs, perforation details, sidetracked junk, bailing tests, shooting and initial production data.

Date	
6/29/67	Spudded at 7:00 P.M. - Santa Fe Drilling, Contractors Drilled 600' Preparing to run IES Log
6/30/67	Ran IES Log - Opened 10-5/8" hole to 13-3/4" to 610' Ran 16 joints of 9-5/8" 32.20#, H-40, new, seamless casing- Shoe at 610' Rigging up and running 9-5/8" casing.
7/1/67	Placed 50 cu.ft. of water ahead of cement. Cemented with 208 sacks of Class G cement, treated with 4% gel and followed with 130 sacks of Class G cement, treated with 2% $CaCl_2$, displaced with 260 cu.ft. of mud. Bumped plug - valve held Good cement returns - landed casing - tested flange weld to 2500 psi. Installing BOPE.
7/2/67	Drilling - Installed BOPE - Tested pipe and BOPE to 1200 psi- Drilled out shoe with 8-3/4" bit.
7/3/67 thru 7/5/67	Drilling
7/6/67	Drilling - Make up Dyna drill - Orient Dyna drill.
7/7/67	Drilling - Ran Dyna drill at 3728' with sealed bearing bit.
7/8/67 thru 7/19/67	Drilling
7/20/67	Drilling - Ran IES Log and Dipmeter to T.D.
7/21/67 thru 7/22/67	Plug #1 - Hung pipe at 3550'. Displaced 50 sacks of Class G cement treated with 2% $CaCl_2$ with 255 cu.ft. of mud. Placed 40 cu.ft. of H_2O ahead. Found top of plug at 3480'. Plug #2 - Hung pipe at 1,000'. Displaced 75 sacks of Class G cement treated with 3% $CaCl_2$ with 55 cu.ft. of mud. Placed 40 cu.ft. of H_2O ahead. Found top of cement at 800'. Plub #3 - Hung pipe at 638'. Displaced 60 sacks of Class G cement treated with 3% $CaCl_2$. Found top at 520'. Removed BOPE - Placed to 25' plug. Welded steel plate on top.

Special Report on Operations Witnessed

No. T 167-663

Mr. Bradford Bishop
209 Fair Oaks Ave., Suite 407
South Pasadena, California 91030

Inglewood, Calif.
July 26, 1967

Agent for BRADFORD BISHOP, OPERATOR

DEAR SIR:

(037-20192)
Operations at well No. "Monterey Park" 1 Sec. 35, T. 1 S, R. 12 W, S.B. B & M.
Field, in Los Angeles County, were witnessed
on July 21, 1967, Mr. L. Axtell, Engineer, representative of the supervisor was present
from 4:30 p.m. to 5:15 p.m. There were also present D. Shepard, Drilling Foreman

Present condition of well: 16" cem. 50'; 9-5/8" cem. 610'. TD 7920', plugged w/cem. 3550'-3480' & 640'-520'.
1000'-800' - See history

The operations were performed for the purpose of witnessing the plugging operations in the process of abandonment.

Mr. ---------- reported:

MR. R. ROTHERMEL, ENGINEER, WAS PRESENT AT THE WELL FROM 5:45 A.M. TO 6:45 A.M. ON JULY 21, 1967 AND MR. SHEPARD REPORTED:

1. An 8-3/4" hole was drilled from 610' to 7920'.
2. On July 21, 1967, 50 sacks of cement was pumped into the hole through 4-1/2" drill pipe hanging at 3550'.

THE ENGINEER NOTED THAT the cement plug at the reported depth of 3480' supported 1/2 of the weight of the drill pipe.

MR. L. AXTELL, ENGINEER, WAS PRESENT AT THE WELL FROM 4:30 P.M. TO 5:15 P.M. ON JULY 21, 1967 AND MR. SHEPARD REPORTED THAT on July 21, 1967, 60 sacks of cement was pumped into the hole through 4-1/2" drill pipe hanging at 640'.
THE ENGINEER NOTED THAT the cement plug at the reported depth of 520' supported 1/4 of the weight of the drill pipe.

THE PLUGGING OPERATIONS AS WITNESSED AND REPORTED ARE APPROVED.

Agent for BRADFORD BISHOP, OPERATOR

Inglewood, Calif.
August 2, 1967

DEAR SIR:

Your proposal to abandon (037-20192) Well No. "Monterey Park" 1, Section 35, T. 1 S., R. 12 W., S.B. B. & M., ---------- Field, Los Angeles County, dated July 20, 1967, received July 31, 1967, has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

THE NOTICE STATES
"THE PRESENT CONDITION OF THE WELL IS:

1. Total Depth: 7920
2. Complete casing record, including plugs:
   50" of 16" conductor pipe cemented to surface
   610' of 9-5/8" casing cemented to surface
3. Last Produced never produced

ADDITIONAL DATA FOR DRY HOLE

4. Oil or Gas showings and results of tests: None
5. Stratigraphic markers and depths: None
6. Formation at bottom: Repetto
7. Base of fresh water sands: 3550 ft."

PROPOSAL
"THE PROPOSED WORK IS
Place cement plug at 3550'-3480'
Place cement plug at 640'-520'
Place 25' cement plug at top of surface casing"

DECISION
THE PROPOSAL, COVERING WORK ALREADY COMPLETED IN ACCORDANCE WITH PRIOR AGREEMENT, IS APPROVED.

Form 109-D (BOPE Memo)

B. O. P. E. MEMO No. T_____

Company BRADFORD BISHOP, OPERATOR Date 7/5 19 67

Operations at well No. "MONTEREY PARK" 1 (037-20192) Sec. 35 T. 1S R. 12W SB B&M.
— Field L.A. County, were witnessed

on 7/3/67. Mr. L. AXTELL, representative of the supervisor was present from 2:30 PM to 3:00 PM. There was also present V. STINNETT, DF

Present condition of well: 16" CEM 50'; 9 5/8" CEM 610', TD 2610'± DRLG

Operations were performed for purpose of inspecting BOP equipment and installation.

Mr. STINNETT reported:

1. On JULY 1 1967, 9 5/8", 32 lb. casing was cemented in a 13 3/4" hole at 610' with 338 sacks/~~cu.ft.~~ of cement.
2. Cement returned/~~did not return~~ to the surface.
__. An additional _____ sacks/cu.ft. of cement was placed around the _____" casing from the surface.
3. The BLIND RAMS, the PIPE RAMS, and the BAG were each tested with a closed-in pressure of 1200 psi for 15 minutes, _____ psi for ___ minutes, and _____ psi for ___ minutes, respectively.
4. A 8 3/4" hole was being drilled ahead at 2610±'.

THE ENGINEER NOTED that the well was equipped with the following BOP equipment:

1. A SHAFFER manually and hydraulically operated double control gate for closing in the well with the drill pipe/~~tubing~~ out of the hole, and for closing around the 4 1/2" drill pipe/~~tubing~~.
2. A HYDRIL blow-out preventer for closing in the well with the drill pipe/~~tubing~~ out of the hole, and for closing around the 4 1/2" drill pipe/~~tubing~~.
__. A _____ manually and hydraulically operated control gate for closing in the well with the drill pipe/tubing out of the hole.
__. A _____ manually and hydraulically operated control gate for closing around the _____" drill pipe/tubing.
__. A _____ blow-out preventer for closing around the _____" drill pipe/tubing.
3. The controls for the above equipment were located outside the derrick and on the derrick floor.
4. A 2" mud fill-up line with a 2" high-pressure stopcock into the 9 5/8" casing below the above equipment.
5. A high-pressure STOPCOCK on the kelly/~~goose-neck~~/~~stand-pipe~~.

__. Remarks _____

THE BLOW-OUT PREVENTION EQUIPMENT AND INSTALLATION ARE APPROVED.

REPORT ON PROPOSED OPERATIONS No. P 167-709

Mr. Bradford Bishop
209 Fair Oaks Ave., Suite 407
South Pasadena, California 91030

Inglewood, Calif.
July 5, 1967

Agent for BRADFORD BISHOP, OPERATOR

DEAR SIR:

Your proposal to drill Well No. "Monterey Park" 1 (037-20192),
Section 35, T. 1 S, R. 12 W, S.B. B. & M., -------- Field, Los Angeles County,
dated June 27, 1967, received June 28, 1967, has been examined in conjunction with records filed in this office.
Present conditions as shown by the records and the proposal are as follows:

THE NOTICE STATES
"Legal description of mineral-right lease, consisting of 100 acres, is as follows:
Portions of Sections 34 and 35, T1S, R12W, as shown on Plat attached hereto
Do mineral and surface leases coincide? Yes X No
Location of Well: 2150 feet North along west line of Sec. 35, 435 feet at right angles to said line from the southwest corner of section 35, T1S, T12W.
Elevation of ground above sea level 343 feet datum.
All depth measurements taken from top of KB which is 12 feet above ground."

PROPOSAL
"PROPOSED CASING PROGRAM

Size of Casing	Weight	Grade and Type	Top	Bottom	Cementing Depths
9-5/8	32.30	H-40	0	600	600 to surface
	15.50	J-55			
5-1/2	17.00	J-55	0	8000	-

Intended zone of completion: Miocene Estimated total depth 8000 ft.
It is understood that if changes in this plan become necessary we are to notify you immediately."

DECISION
THE PROPOSAL IS APPROVED PROVIDED:

1. Fluid consistent with good drilling practice shall be used, and the column of fluid maintained at all times to the surface, particularly while pulling the drill pipe.
2. Adequate blowout prevention equipment shall be installed and maintained in operating condition at all times.
3. THIS DIVISION SHALL BE NOTIFIED:
   a. To inspect the installed blowout prevention equipment before drilling below 1500'.
   b. To witness a test of the effectiveness of the 5-1/2" water shut-off above any zone to be produced.

I (WE) CERTIFY THAT I HAVE READ AND EXAMINED THIS APPLICATION AND KNOW THE SAME TO BE TRUE AND CORRECT. ALL PROVISIONS OF LAWS AND ORDINANCES GOVERNING THIS TYPE OF WORK WILL BE COMPLIED WITH WHETHER SPECIFIED HEREIN OR NOT. THE GRANTING OF A PERMIT DOES NOT PRESUME TO GIVE AUTHORITY TO VIOLATE OR CANCEL THE PROVISIONS OF ANY STATE OR LOCAL LAW REGULATING CONSTRUCTION OR THE PERFORMANCE OF CONSTRUCTION. PERMIT EXPIRES IF WORK IS NOT STARTED WITHIN 180 DAYS OF ISSUANCE OR IF WORK IS SUSPENDED OR ABANDONED FOR A PERIOD OF 180 DAYS AT ANY TIME AFTER WORK IS COMMENCED. A SEPARATE PERMIT MUST BE OBTAINED FOR EACH FUNCTION BEFORE PROCEEDING WITH THAT WORK, AND PERMIT MAY BE REVOKED AT ANY TIME UPON VIOLATION OF ANY OF THE ABOVE CONDITIONS.

DECLARATIONS

The Declarations below are required by the State of California under Section 19825 of the Health and Safety Code. The additional cost of printing and permit application processing caused by these requirements can only be passed on to the applicant as they are not recoverable from the state.

LICENSED CONTRACTOR'S DECLARATION

I hereby affirm that I am licensed under provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

License Class C-16 License No. 182273

Exp. Date 5/31/81 Contractor VIKING FIRE PROT.

VIKING FIRE PROT. INC 682-6800
CONTRACTOR (DBA) Phone
2990 E. MIRALOMA ANAHEIM CA. 92
Address City Zip

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031, California Business and Professions Code): Any City which requires a permit to construct, alter, improve, demolish or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractor's License Law (Ch. 9) (Commencing with Sec. 7000) of Div. 3 of the B. & P. C.) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Sec. 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500.00):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. _____ B. & P. C. for this reason:

Date _____ Owner _____

WORKER'S COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self-insure or a certificate of Worker's Compensation Insurance or a certified copy thereof (Sec. 3800, Lab. C.).

Policy No. WC 427-71-64 Company CROSBY & HARVEY

☐ Certified copy is hereby furnished.

☒ Certified copy is filed with the Department of Building & Safety.

Date 9-23-80 Applicant P. Smith

CERTIFICATE OF EXEMPTION FROM WORKER'S COMPENSATION INSURANCE

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Worker's Compensation Laws of California.

Date _____ Applicant _____

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Work's Comp. provisions of the Labor Code, You must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name _____

Lender's Address _____

I certify that I have read this application and state that the above information is correct. I agree to comply with all City and State laws relating to the building construction, and hereby authorize representatives of this City to enter upon the above-mentioned property for inspection purposes.

X P. Smith 9-23-80
Signature of Owner or Contractor (AGENT ONLY) Date

Owner Verified By | City Lic. Verified By

— IMPORTANT —

Application is hereby made to the Director of Building and Safety for a permit subject to the conditions and restrictions set forth on the front of this application.

If work authorized by this permit is not commenced within 180 days of issuance date, or if work is suspended or abandoned for a period of 180 days, the permit shall become null and void by this limitation. A signed inspection on job card will keep permit valid for no more than 180 days.

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, California Business and Professions Code: Any City which requires a permit to construct, alter, improve, demolish or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractor's License Law (Ch. 9) (Commencing with Sec. 7000) of Div. 3 of the B. & P. C.) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Sec. 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500.00):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. ..... B. & P. C. for this reason:

Date ..... Owner .....

WORKER'S COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self-insure or a certificate of Worker's Compensation Insurance or a certified copy thereof (Sec. 3800, Lab. C.).

Policy No. 275 KE 681 [illegible] Company Amer. Mem.

☐ Certified copy is hereby furnished.

☒ Certified copy is filed with the Department of Building & Safety.

Date 11-20-80 Applicant Philip Perez

CERTIFICATE OF EXEMPTION FROM WORKER'S COMPENSATION INSURANCE

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Worker's Compensation Laws of California.

Date ..... Applicant .....

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Work's Comp. provisions of the Labor Code, You must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name .....

Lender's Address .....

I certify that I have read this application and state that the above information is correct. I agree to comply with all City and State laws relating to the building construction, and hereby authorize representatives of this City to enter upon the above-mentioned property for inspection purposes.

Signature of Owner or Contractor (AGENT) Date 11/26/80

Owner Verified By	City Lic. Verified By

— IMPORTANT —

Application is hereby made to the Director of Building and Safety for a permit subject to the conditions and restrictions set forth on the front of this application.

If work authorized by this permit is not commenced within 180 days of issuance date, or if work is suspended or abandoned for a period of 180 days, this permit shall become null and void by this limitation. A signed inspection on job card will keep permit valid for no more than 360 days.

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, California Business and Professions Code): Any City which requires a permit to construct, alter, improve, demolish or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractor's License Law (Ch. 9 (Commencing with Sec. 7000) of Div. 3 of the B. & P. C.) or that he is exempt therefrom and the basis for the alleged exemption. Any violation of Sec. 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500.00):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, B. & P. C.): The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.)

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. _____ B. & P. C. for this reason:

Date _____ Owner _____

DECLARATIONS

The Declarations below are mandated by the State of California under Section 19825 of the Health and Safety Code. The additional cost of printing and permit application processing caused by these requirements can only be passed on to the applicant as they are not recoverable from the state.

LICENSED CONTRACTOR'S DECLARATION

I hereby affirm that I am licensed under provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

License Class C20 License No. 381440

Exp. Date 2/29/96 Signature of Contractor

Perfect Air Control
CONTRACTOR (D B A)

1815 Atlantic Ave Long Beach 90807
ADDRESS City Zip

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5 California Business and Professions Code: Any City which requires a permit to construct, alter, improve, demolish or repair any structure, prior to its issuance also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractor's License Law (Ch. 9) (Commencing with Sec. 7000) of Div. 3 of the B. & P. C.) or that he is exempt therefrom and the basis for the alleged exemption. Any violations of Sec. 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500.00.):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. ..... B. & P. C. for this reason:

Date 5/23/95 Signature of Owner

WORKER'S COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self-insure or a certificate of Worker's Compensation Insurance or a certified copy thereof (Sec. 3800 Lab. C.).

Policy No. W95 1113179 Company California Compensation

☐ Certified copy is hereby furnished.

☐ Certified copy is filed with the Department of Building & Safety.

Date 5/23/95 Applicant

CERTIFICATE OF EXEMPTION FROM WORKER'S COMPENSATION INSURANCE

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Worker's Compensation Laws of California.

Date ..... Applicant .....

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Work's Comp. provisions of the Labor Code, You must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name .....

Lender's Address .....

I certify that I have read this application and state that the above information is correct. I agree to comply with all City and State laws relating to the building construction, and hereby authorize representatives of this City to enter upon the above-mentioned property for inspection purposes.

5/23/95
Signature of Owner or Contractor ONLY Date

Owner Verified By:	City Lic. Verified By:

— IMPORTANT —

Application is hereby made to the Director of Building and Safety for a permit subject to the conditions and restrictions set forth on the front of this application.

If work authorized by this permit is not commenced within 180 days of issuance date, or if work is suspended or abandoned for a period of 180 days, this permit shall become null and void by time limitation. A signed inspection on job card will keep permit valid for no more than 180 days.

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5 California Business and Professions Code: Any City which requires a permit to construct, alter, improve, demolish or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractor's License Law (Ch. 9) (Commencing with Sect. 7000) of Div. 3 of the B. & P. C.) or that he is exempt therefrom and the basis for the alleged exemption. Any violations of Sec. 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500.00.):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5, California Business and Professions Code. Any City which requires a permit to construct, alter, improve, demolish or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractor's License Law (Ch. 9) (Commencing with Sec. 7000) of Div. 3 of the B. & P. C.) or that he is exempt therefrom and the basis for the alleged exemption. Any violations of Sec. 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500.00.):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. ..... B. & P. C. for this reason:

Date ..... Signature of Owner .....

WORKER'S COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self-insure or a certificate of Worker's Compensation Insurance or a certified copy thereof (Sec. 3800, Lab. C.).

Policy No. ..... Company .....

☐ Certified copy is hereby furnished.

☐ Certified copy is filed with the Department of Building & Safety.

Date ..... Applicant .....

CERTIFICATE OF EXEMPTION FROM WORKER'S COMPENSATION INSURANCE

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Worker's Compensation Laws of California.

Date 10/10/95 Applicant Steve Katt

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Work's Comp. provisions of the Labor Code, You must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name .....

Lender's Address .....

I certify that I have read this application and state that the above information is correct. I agree to comply with all City, and State laws relating to the building construction, and hereby authorize representatives of this City to enter upon the above-mentioned property for inspection purposes.

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Sec. 7031.5 California Business and Professions Code: Any City which requires a permit to construct, alter, improve, demolish or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he is a licensed contractor pursuant to the provisions of the Contractor's License Law (Ch. 9) (Commencing with Sec. 7000) of Div. 3 of the B. & P. C.) or that he is exempt therefrom and the basis for the alleged exemption. Any violations of Sec. 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500.00.):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec. 7044 B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or through his own employees, provided that such improvements are not intended or offered for sale. If, however, the building or improvement is sold within one year of completion, the owner-builder will have the burden of proving that he did not build or improve for the purpose of sale.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B. & P. C.: The Contractor's License Law does not apply to an owner of property who builds or improves thereon, and contracts for such projects with a contractor(s) licensed pursuant to the Contractor's License Law.).

☐ I am exempt under Sec. ..... B. & P. C. for this reason:

Date ..... Owner .....

WORKER'S COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self-insure or a certificate of Worker's Compensation Insurance or a copy certified copy thereof (Sec. 3800, Lab. C.).

Date 9-8-82 Applicant J. H. BRYANT INC

CERTIFICATE OF EXEMPTION FROM WORKER'S COMPENSATION INSURANCE

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Worker's Compensation laws of California.

Date ..... Applicant .....

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Work's Comp. provisions of the Labor Code, You must forthwith comply with such provisions or this permit shall be deemed revoked.

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name .....

Lender's Address .....

I certify that I have read this application and state that the above information is correct. I agree to comply with all City, and State laws relating to the building construction and hereby authorize representatives of this City to enter upon the above-mentioned property for inspection purposes.

— IMPORTANT —

Application is hereby made to the Director of Building and Safety for a permit subject to the conditions and restrictions set forth on the front of this application.

If work authorized by this permit is not commenced within 180 days of issuance date, or if work is suspended or abandoned for a period of 180 days, this permit shall become null and void by time limitation. A signed inspection or job card will keep permit valid for no more than 180 days.
