Based on requests from the City to enhance the design of the Project, and in response to comments on the IS/MND from agencies and the public, the Applicant updated certain elements of the Project design and adjusted certain operational characteristics to be responsive to the Lead Agency and public input. Accordingly, the analysis contained in this Supplemental Technical Analysis supersedes, where applicable, and supplements the analysis contained in the IS/MND. As demonstrated in this Supplemental Technical Analysis, the adjustments in the Project do not result in new significant impacts. In addition, it should be noted that the adjustments result mainly in a less intensive project in several instances, including, but not limited to, less energy demand, improved emissions control technology, less water consumption, and improved aesthetic value.

With respect to the technical modeling data included herein, this Supplemental Technical Analysis was prepared in accordance with the regulatory requirements of the South Coast Air Quality Management District (SCAQMD or South Coast AQMD) and guidance documents from the Office of Environmental Health Hazard Assessment (OEHHA) for analysis of air quality impacts and potential health risks. In addition, this Supplemental Technical Analysis supplements the IS/MND analysis regarding greenhouse gas (GHG) emissions, energy demand, and noise generation consistent with applicable CEQA requirements, applicable thresholds of significance, and applicable regulatory guidance. Overall, this supplemental information adds to the body of substantial evidence supporting the analysis and conclusions in the IS/MND.

Technical data is included as **Attachments A through F** below.

2.0 PROJECT DESIGN ADJUSTMENTS

In response to guidance from the Lead Agency, and comments received during the public review period for the IS/MND, the Applicant updated the architectural design of the Project and adjusted certain operational characteristics.

The adjustments to the Project, which are relevant to quantitative technical analysis, are included in **Table 1: Project Design Adjustments**.

Table 1: Project Design Adjustments

Project Design Adjustments		
Project Design	**Previous**	**Current**
Earthwork (cubic yards of import)[1]	-	196,275
Earthwork (cubic yards of export)	65,000	-
Energy (annual kWh/year)[2]	438,014,593	433,620,000
Water use (gallons/year)[3]	12,056,315	10,978,835
Building (square feet)[4]	218,400	247,480
Facility Power Demand (MW)[5]	49.9	49.5
Number of Generators[6]	14	24
Generator Capacity (MW)	4.0	2.75

1. Increased import to support new building design.
2. Reduced energy load for smaller data halls.
3. Reduced water usage due to efficient technology, closed-loop system, and improved landscaped plan.
4. Increased square footage to accommodate new design. Approximately 13,264 square feet of new design is architectural features and unoccupied.
5. Reduced power demand for smaller data halls.
6. Improved generator technology to Tier 4 equipment; reduced size, and increased number, of emergency generators per market availability and South Coast AQMD certified generator list.

2.1 Emergency Generator Operating Assumptions for Technical Analysis

Table 2: Emergency Generator Operating Assumptions provides the generator operating assumptions for the following analyses included in this document. This modeling is provided in response to certain public comments on the IS/MND and demonstrates that emission levels from the emergency generators remain less than significant.

Table 2: Emergency Generator Operating Assumptions

Analysis Scenario	Number of Generators	Generator Rating (MW)	Hours of Operation
Criteria Pollutants, regional[1]	N/A	2.75	13/day

Analysis Scenario	Number of Generators	Generator Rating (MW)	Hours of Operation
Criteria Pollutants, localized[1]			
1-hour	1+		1/day
8-hour	2+		8/day
24-hour	4-24		13/day
Potential to Emit (PTE)[2]	24	2.75	50/year
Greenhouse Gas Emissions[1]			
Health Risk (Toxic Air Contaminants Emissions)[3]			
NO_X National Ambient Air Quality Standard (NAAQS) Analysis[4]	24		200/year

1. Assumes hours of maintenance and testing limited to no more than 13 hours per day from all generators. South Coast AQMD permits typically limit each generator to no more than 4.2 hours per calendar month. Routine testing must be performed during the day so that the operator can view the exhaust.
2. South Coast AQMD Rule 1470 (c)(2)(C)(i) limits engine operation for maintenance and testing to 50 hours per year. Also pursuant to South Coast AQMD's policy and procedures No. EC-02-09, dated February 24, 2009.
3. The analysis assumes up to 50 hours per year of generator use for testing and maintenance, which reflects applicable regulatory limits and industry practice.
4. In accordance with U.S. EPA's *Modeling Compliance of The Federal 1-Hour NO_2 NAAQS Guidance*. The hours of operations assumption for NO_z NAAQS analysis only.

Per industry standard and applicable modeling protocol, the Project appropriately applied different operational assumptions for different types of emissions analyses, consistent with applicable guidance. For CEQA purposes, the Project's criteria pollutant emissions were conservatively estimated assuming no more than 13 hours per day of non-emergency testing and maintenance across all generators, which reflects reasonable Standard Operating Procedure (SOP) for the Project. While South Coast AQMD's and CARB's regulatory framework limits annual testing and maintenance to 50 hours per generator, the CEQA analysis applied the more conservative daily cap of 13 hours per day across all units to ensure that potential localized and cumulative criteria pollutant impacts were fully disclosed, and to appropriately compare impacts to South Coast AQMD CEQA criteria pollutant thresholds, which are based on maximum daily emissions rather than annual permitted emissions.

For the purpose of determining the Project's Potential To Emit (PTE), emissions were calculated assuming 50 hours per year per generator, which reflects the legally enforceable non-emergency testing and maintenance limit under the CARB Airborne Toxic Control Measure (ATCM) for Stationary Diesel Engines (California Code of Regulations, Title 17, §93115) and South Coast AQMD Rule 1470 (c)(2)(C)(i). For comparison with CEQA thresholds, emissions of Toxic Air Contaminants (TAC), such as diesel particulate matter (DPM), were calculated assuming 50 hours of annual operation for testing and maintenance per generator, which reflects the California Air Resources Board (CARB) Airborne Toxic Control Measure (ATCM) for Stationary

Diesel Engines (California Code of Regulations, Title 17, §93115) and South Coast AQMD Rule 1470 parameters; and applicable OEHHA guidance.

By contrast, for the 1-hour NO_2 NAAQS analysis, emissions were modeled assuming up to 200 hours of annual operation per generator. This approach follows U.S. EPA and South Coast AQMD guidance, including the 1995 EPA *Seitz Memorandum* and U.S. EPA's *Modeling Compliance of The Federal 1-Hour NO_2 NAAQS Guidance*. Localized impacts were modeled in accordance with **Table 2: Emergency Generator Operating Assumptions**, depending on the averaging period of each pollutant studied.

2.2 Potential to Emit

To support the data center's maximum load demand of 49.5 MW the Project would install approximately 24 back-up generators, each at 2.75 MW and certified to meet U.S. EPA Tier 4 emission standards. The maximum facility power demand could be met with 18 generators. An additional 6 generators will be installed to provide redundancy, if needed, for maintenance periods or equipment failure. For the purposes of this memorandum, however, the analysis assumes all 24 generators operating at full rated load, even though testing and maintenance are typically performed at partial loads (80 to 90 percent load). This approach provides a highly conservative basis for evaluating potential emissions.

Table 3: Project Potential to Emit lists the potential to emit (PTE) assuming 18 plus 6 redundant engines certified to U.S. EPA Tier 4 emissions standards operating at 50 hours per year, as required by South Coast AQMD Rule 1470 (c)(2)(C)(i), which limits engine operation for maintenance and testing to 50 hours per year. As shown in **Table 3**, the Project PTE would not exceed, and is well below, Title V thresholds.

Table 3: Project Potential to Emit

Scenario	Criteria Pollutant Emissions (tons per year)							
	VOC	NO_x	CO	SO_2	PM_{10}	$PM_{2.5}$	HAPs	Single HAP
50 hours per year per generator								
Project PTE [1,2]	0.68	2.44	4.90	0.03	0.11	0.11	<0.10	<0.10
Title V Threshold	100	100	100	100	100	100	25	10
Exceed Title V Threshold?	***No***	***No***	***No***	***No***	***No***	***No***	***No***	***No***

1. PTE assumed the installation of 18 plus 6 redundant Tier 4 2.75 MW generators operating at 50 hours per year, and South Coast AQMD's policy and procedures No. EC-02-09, dated February 24, 2009.
2. The generators would include a selective catalytic reduction (SCR) system, using catalyst and reductant (injected urea) to reduce the level of air pollutants.

Refer to **Attachment A: Potential to Emit Calculations** for model outputs.

3.0 AIR QUALITY AND GREENHOUSE GAS ANALYSIS

3.1 Methodology

As discussed above, in response to public comments and guidance from the City, the Applicant improved the Project design and modified certain operational characteristics. Accordingly, this Supplemental Technical Analysis has updated CalEEMod modeling to analyze the project adjustments, and included certain elements as requested by commenting agencies. **Table 4: CalEEMod Input Changes** presents a comparison between the CalEEMod inputs used in the IS/MND and the updated inputs applied in this analysis.

Table 4: CalEEMod Input Changes

CalEEMod Input Changes		
Inputs	**Previous**	**Current**
Earthwork (cubic yards of import)	-	196,275
Earthwork (cubic yards of export)	65,000	-
Energy (annual kWh/year)	438,014,593	433,620,000
Water use (gallons/year)	12,056,315	10,978,835
Building (square feet)	218,400	247,480

3.2 Air Quality Construction Emissions

As noted above, the Project design has advanced, and CalEEMod was updated to incorporate the refined Project square footages and grading quantities to ensure that construction-related emissions estimates reflect the revised design. **Table 5: Project Construction Emissions** summarizes the construction emissions attributable to the Project. As shown in **Table 5**, construction criteria pollutant emissions would remain below the applicable thresholds, and construction impacts on short-term regional air quality would remain less than significant, as identified in the IS/MND.

Table 5: Project Construction Emissions

Calendar Year	Emissions (pounds per day)[1]					
	ROG	NO_X	CO	SO_2	PM10	PM2.5
2025	5.76	97.33	68.64	0.33	20.30	8.86
2026	3.70	74.33	54.92	0.31	15.44	5.58
2027	39.45	7.74	15.87	0.02	2.16	0.66
2027 (Off-Site Improvements)	3.88	26.73	27.05	0.10	0.99	0.91
SCAQMD Threshold	75	100	550	150	150	55
SCAQMD Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

1. Emissions were calculated using the CalEEMod version 2022.1, as recommended by the South Coast AQMD. Worst-case seasonal maximum daily emissions are reported.

Calendar Year	Emissions (pounds per day)[1]					
	ROG	NO_X	CO	SO_2	PM10	PM2.5
Source: CalEEMod version 2022.1. Refer to **Attachment B: AQ and GHG Modeling Data** for model outputs.						

3.3 Air Quality Operational Emissions

As noted above, CalEEMod was updated to incorporate the refined Project design, and respond to certain public comments. The Project would include approximately 18 plus 6 redundant Tier 4 generators, rated at 2.75 MW each, to provide emergency power if needed. The analysis assumes up to 50 hours per year of generator use for testing and maintenance consistent with applicable regulatory limits and industry practice. **Table 6: Project Operational Emissions** summarizes the operational emissions attributable to the Project.

Table 6: Project Operational Emissions

Source	Emissions (pounds per day)[1]					
	ROG	NO_X	CO	SO_2	PM10	PM2.5
Area	8.44	0.10	11.80	<0.01	0.02	0.02
Energy[2]	0.00	0.00	0.00	0.00	0.00	0.00
Mobile	0.18	0.16	1.88	<0.01	0.46	0.12
Emergency Generators[3]	14.80	52.85	105.69	0.58	2.33	2.33
Total	**23.42**	**53.11**	**119.38**	**0.58**	**2.78**	**2.44**
SCAQMD Threshold	55	55	550	150	150	55
SCAQMD Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

1. Emissions were calculated using the California Emissions Estimator Model (CalEEMod) version 2022.1.1.22, as recommended by South Coast Air Quality Management District (SCAQMD). Worst-case seasonal maximum daily emissions are reported.
2. Criteria pollutant emissions from energy sources are calculated in CalEEMod from only natural gas use. The Project would not use natural gas.
3. Calculations were performed in spreadsheet calculations. The modeling assumed no more than13 hours of testing and maintenance run time in any one day for all generators.

Source: CalEEMod version 2022.1. Refer to **Attachment B: AQ and GHG Modeling Data** for model outputs.

As noted above, the Project will implement a SOP that limits testing and maintenance across all 18 plus 6 redundant generators to no more than 13 hours per day. Testing and maintenance activities generally include regularly scheduled start-ups, and run-time checks to ensure the generators remain in proper working condition. These activities typically involve operating each generator under load for a short period of time (e.g., 30–60 minutes) on a monthly or quarterly basis, inspecting fuel, oil, and cooling systems, and verifying that emissions controls are functioning as designed. These procedures are carried out under controlled conditions. As shown in **Table 6**, the Project's regional operational emissions would not exceed applicable South Coast AQMD thresholds, and operational impacts on long-term regional air quality would remain less than significant, as identified in the IS/MND.

3.4 Greenhouse Gas Construction Emissions

Table 7: Construction Greenhouse Gas Emissions summarizes the annual GHG emissions generated by construction of the Project. GHG emissions related to construction were quantified and disclosed in this report, and the IS/MND for informational purposes only, because the Lead Agency exercised its discretion to determine GHG impact conclusions based on compliance with the City's Climate Action Plan (CAP). The CAP is a qualified local GHG reduction plan under CEQA, which can be used to determine the significance of GHG emissions from a Project.

Table 7: Construction Greenhouse Gas Emissions

Year	$MTCO_2e$ per year
Construction (2025)	1,050
Construction (2026)	515
Construction (2027)	258
Total	1,823
Amortized Over 30 Years	61
Source: CalEEMod version 2022.1. Refer to **Attachment B: AQ and GHG Modeling Data** for model outputs.	

3.5 Greenhouse Gas Operational Emissions

Table 8: Operational Greenhouse Gas Emissions summarizes the annual GHG emissions generated by operations of the Project reflecting the updated design. The Project during peak load conditions would have a demand of 49.5 MW, which will under normal conditions be supplied by SCE. However, as discussed above, diesel fuel will be combusted on site to perform monthly testing and maintenance. Consistent with CEQA and South Coast AQMD's requirement to evaluate reasonably foreseeable operating conditions, the analysis assumes up to 50 hours per year of generator use for testing and maintenance. GHG emissions associated with the proposed emergency generators are summarized in **Table 8: Operational Greenhouse Gas Emissions**.

Table 8: Operational Greenhouse Gas Emissions

Emissions Source	$MTCO_2e$ per Year[1]
Amortized Construction Emissions	61
Area Source	6
Emergency Generators [1,2]	1,616
Mobile	80
Waste	78
Water and Wastewater	12

Emissions Source	MTCO$_2$e per Year[1]
Refrigeration	0.1
Energy[3]	75,181
Total Emissions[4]	77,034

1. Emergency backup generator emissions calculated assuming 50 hours per year per generator (18 plus 6 redundant generators).
2. Annual GHG emissions were reduced compared to the previous design because the Project generators changed from twelve 4 MW units without selective catalytic reduction (SCR) to 18 plus 6 redundant 2.75 MW Tier 4 units equipped with SCR. Although the total number of units increased, the smaller generator size and the incorporation of improved emissions controls resulted in lower overall annual GHG emissions.
3. The servers in the data center were estimated to require approximately 50 MW of power per hour, and operations were conservatively estimated to be 8,760 hours per year. The Project does not include natural gas heaters or water heaters.
4. Represents a conservative estimate of maximum potential emissions. No quantitative credit for existing land use or regulatory compliance reductions that could occur over time. GHG emissions reduced from initial design in IS/MND..

Source: CalEEMod version 2022.1. Refer to **Attachment B: AQ and GHG Modeling Data** for model outputs.

4.0 DISPERSION MODELING METHODOLOGY

4.1 Input Data

As recommended by the South Coast AQMD, the Supplemental Technical Analysis utilizes an appropriate air quality dispersion model (i.e. AERMOD) to evaluate localized air quality impacts to the 1-hour NO_X federal and State ambient air quality standards (AAQS) from the operation of the emergency generators.

The air dispersion modeling for the operational risk assessment was performed using U.S. EPA AERMOD dispersion model. AERMOD is a steady-state, multiple-source, Gaussian dispersion model designed for use with emission sources situated in terrain where ground elevations can exceed the stack heights of the emission sources (not a factor in this case). AERMOD requires hourly meteorological data consisting of wind vector, wind speed, temperature, stability class, and mixing height. The modeling and analysis were prepared in accordance with the South Coast AQMD Modeling Guidance for AERMOD.[1]

1. **Meteorological Data** – AERMOD requires hourly meteorological data consisting of wind vector, wind speed, temperature, atmospheric stability, and mixing height. The latest 5-year meteorological data set for the Pico Rivera Monitoring Station was obtained from the South Coast AQMD. Surface and upper air meteorological data from this station was selected as being the most representative for meteorology based on proximity to the Project site, as well as terrain, surrounding land uses, and surface characteristics.

[1] South Coast Air Quality Management District, *SCAQMD Modeling Guidance for AERMOD*, www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/modeling-guidance. Accessed October 8, 2025.

2. **Source Data** – The Project includes enclosed emergency generators to provide emergency power, if needed. The generators are located adjacent to the northern wall of the building. There would be 18 plus 6 redundant Tier 4 emergency diesel engines. See **Figure 1** for more detail. Each gen-set is currently designed to have a unique 24-inch diameter, vertical exhaust stack that will be routed to the roof of the building. The emissions from each generator were modeled as a single point source.

   Health Risk Analysis: For the purpose of modeling long-term health risk impacts, this analysis assumed each of the 18 plus 6 redundant Tier 4 emergency diesel engines would operate for 50 hours per year, refer to **Table 2**. The average annual emission rates for each point source were derived from manufacturer-provided engine specifications and calculated following South Coast AQMD guidance. All 18 plus 6 redundant engines were modeled as individual point sources. Refer to **Appendix C** for detailed calculations.

   Localized Impact Analysis: For the purposes of the operational localized impact analysis, emission rates were developed to reflect the averaging times of the applicable AAQS. For the 1-hour NO_X and CO standards and the 8-hour CO standard, the analysis assumed that three engines could operate concurrently at peak hourly emission rates for up to 13 hours per day, consistent with the Project's SOP. Accordingly, three point sources were modeled to represent this operational scenario. For the 24-hour PM10 and PM2.5 standards, the analysis assumed all 18 plus 6 redundant engines could operate concurrently at peak hourly emission rates for up to 13 hours per day, also consistent with the SOP. In this case, 24 point sources were modeled to evaluate localized particulate matter impacts. Refer to **Attachment D: LST and NAAQS Modeling Data** for detailed calculations.

   NAAQS Analysis: For the purposes of modeling long-term impacts, this analysis assumed each of the 18 plus 6 redundant engines would run for 200 hours per year. For this scenario, all 18 plus 6 redundant engines were modeled as individual point sources. Refer to **Attachment D: LST and NAAQS Modeling Data** for detailed calculations.

3. **Receptor Locations** – A plant boundary cartesian grid was used to define the receptor network at the property fence-line and beyond the facility boundary. Due to the size of the project site, receptors were modeled with a maximum of 40-meter grid spacing. The receiver grid extended 1,000 feet in every direction from the project site boundary. All receptor locations are represented in the Universal Transverse Mercator (UTM) projections, Zone 11, North American Datum 1983.

4. **Terrain Elevations** – As recommended by the South Coast AQMD, the United States Geological Survey (USGS) National Elevation Dataset (NED) terrain data was imported into AERMOD.

5. **Building Downwash** – The potential effect for building downwash was evaluated via the "Good Engineering Practice (GEP)" stack height analysis and was based on the scaled site plan developed for the site (see **Figure 1**). The proposed building was digitized using the site plan (sheet A2.0) with a height of 12 meters (42 feet including building parapet). The building profile input program (BPIP) was incorporated into AERMOD, to account for potential downwash effects.

5.0 HEALTH RISK ANALYSIS

5.1 Carcinogenic Risk

As requested by the South Coast AQMD, this Supplemental Technical Analysis conducted an operational Health Risk Assessment (HRA) that evaluates the potential impact of the emergency generators together with other project operations. This information supplements the IS/MND's analysis of the potential cancer risks and compares these risks to the South Coast AQMD air quality significance thresholds for TACs. It should also be noted that, although South Coast AQMD's Rule 1401 generally requires a health risk assessment (HRA) for new or modified toxic air contaminant sources, the rule includes an exemption for emergency standby internal combustion engines. Specifically, Rule 1401(k)(3)(C) provides that emergency engines meeting CARB certification requirements and limited to less than 50 hours per year of non-emergency use are presumed to comply with the Rule's cancer risk and hazard index limits. Nonetheless, the City as the Lead Agency has supplemented the IS/MND will additional HRA analysis. The Project is anticipated to utilize 18 (plus 6 for redundancy) Cummins Inc. QSK78 engines, which are certified to meet U.S. EPA Tier 4 Final emission standards. The generators selected for this Project are currently listed on the South Coast AQMD Certified ICE-Emergency Generators List (as of *May 23, 2025*). Emergency generator emission rates were calculated using the manufacturers' specifications (e.g., brake-horsepower, fuel consumption, exhaust parameters). See **Attachment C: Health Risk Data** for more details.

Table 9: Carcinogenic Risk Assessment shows the health risk for the following scenarios: construction, operation, and combined construction and operation of the Project. Based on OEHHA *Risk Assessment Guidelines*, the exposure duration for a resident is 30 years, beginning with the third trimester. The analysis conservatively calculates risk based on exposure to construction concentrations during the 2 years of the exposure duration and overlapping operational concentrations for the entire exposure duration of 30 years.

The pollutant concentrations modeled in AERMOD represent the exposure levels outdoors. The analysis conservatively does not include indoor exposure adjustments for residents. However, the typical person spends the majority of time indoors rather than remaining outdoors in the same location for 24 hours a day.[2] Therefore, the AERMOD outdoor pollutant concentrations are not necessarily representative of actual exposures and tend to overestimate exposure. The

[2] U.S. Environmental Protection Agency, Exposure Factors Handbook: 2011 Edition EPA/600/R-090/052F, September 2011.

nearest residential receptors would be located approximately 330 feet east from exhaust stacks on the generators. The risk calculations are based on the pollutant concentration at the worst-case location and conservatively assume: no cleaner technology or lower emissions in future years, and 95th percentile breathing rates. **Table 9** shows the cancer risk associated with construction and operation of the Project would be below the applicable significance threshold for all receptors.

Table 9: Carcinogenic Risk Assessment

Exposure Scenario	Cancer Risk (Risk per Million)[1]	Significance Threshold (Risk per Million)	Exceeds Significance Threshold?
Construction			
Residential Receptors	3.41	10	No
Worker Receptor	0.16	10	No
Operations			
Residential Receptors	5.67	10	No
Worker Receptor	1.90	10	No
Combined Construction + Operation			
Residential Receptors	6.35	10	No
Worker Receptor	2.06	10	No
1. The reported cancer risk is at the closest maximally exposed individual receptor (MEIR) to the Project site.			
Source: Refer to **Attachment C: Health Risk Data**.			

As shown in **Table 9**, the construction risk at residential and worker receptors would be 3.41 in one million and 0.16 in one million, respectively. Additionally, the operational cancer risk at residential and worker receptors would be 5.67 and 1.90 in one million, respectively. Further, the combined construction and operational cancer risk[3] at residential and worker receptors would be 6.35 and 2.06 in one million, respectively. As such, the maximum construction, operational, and combined construction and operational cancer risk would not exceed South Coast AQMD's 10 in one million threshold.

5.2 Non-Carcinogenic Hazard

In response to South Coast AQMD's recommendation, this Supplemental Technical Analysis includes an evaluation of potential TAC exposure during both construction and operation of the Project. Consistent with South Coast AQMD Rule 1401 and CEQA guidance, the applicable significance threshold for chronic non-cancer risk is a hazard index (HI) greater than 1.0. Chronic non-cancer impacts are calculated by dividing the annual average concentration by the Reference Exposure Level (REL) for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated and is designed to protect sensitive

[3] Based on OEHHA *Risk Assessment Guidelines*, the exposure duration for a resident is 30 years, beginning with the third trimester. As such, the combined construction and operations scenario includes the recommended residential exposure during of 30 years in sequential order.

individuals within the population. According to OEHHA, the chronic REL DPM is 5, with the target organ being the respiratory system.[4]

Chronic non-carcinogenic impacts are shown in **Table 10: Chronic Hazard Assessment**. A chronic hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the chronic exposure by the reference exposure level. The chronic hazard was calculated based on the highest annual average concentration at the maximally exposed individual receptor. It should be noted that there is no acute REL for DPM and acute health risk cannot be calculated. The highest maximum chronic hazard index associated with DPM emissions from Project construction would be 0.004 and 0.003 at the residential and worker receptors, respectively. Additionally, the highest maximum chronic hazard index associated with DPM emissions from Project operations would be 0.002 at the residential receptors and 0.001 at the worker receptors. Therefore, construction and operational non-carcinogenic hazards would not exceed the applicable South Coast AQMD threshold of 1.0.

Table 10: Chronic Hazard Assessment

Exposure Scenario	Annual Concentration (µg/m^3)[1]	Chronic Hazard
Construction		
Residential Receptors	0.021	0.004
Worker Receptors	0.016	0.003
Operation		
Residential Receptors	0.009	0.002
Worker Receptors	0.006	0.001
SCAQMD Threshold	*N/A*	*1.0*
Threshold Exceeded?	**N/A**	**No**
1. The reported pollutant concentration is at the closest receptor (maximally exposed individual receptor).		
Source: Refer to **Attachment C: Health Risk Data**.		

6.0 AAQS ANALYSIS

6.1 Background of Air Quality Standards

For the purposes of establishing background concentrations of criteria pollutants, this analysis relied on South Coast AQMD monitoring data, which were collected during the years 2021, 2022, and 2023 at CARB/South Coast AQMD monitoring stations. Background values were selected from the monitoring station with the closest proximity to the Project site, the Pico Rivera Monitoring Station.

[4] California Office of Environmental Health Hazard Assessment, *OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary*, https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary. Accessed October 8, 2025.

6.2 Localized Significance Analysis

Construction

As requested by South Coast AQMD, and to reflect the updated design requested by the Lead Agency, CalEEMod was updated to incorporate construction and operation emissions and ensure that impacts remained less than significant as set forth in the IS/MND. **Table 11: Localized Significance of Construction Emissions**, shows the results of localized emissions during construction activity. This table represents the worst-case scenario and are based on peak earthwork volumes anticipated. As shown in **Table 11,** localized Project construction emissions would not exceed South Coast AQMD thresholds and impacts would remain less than significant, as identified in the IS/MND.

Table 11: Localized Significance of Construction Emissions

Source/Activity	Emissions (pounds per day)[1]			
	NO_X	CO	PM10	PM2.5
Construction Emissions				
Phase 1 - Demolition (2025)	22.2	19.9	3.9	1.3
Phase 1 – Site Preparation (2025)	31.6	30.2	6.5	3.9
Phase 1 – Grading (2025)	16.3	17.9	2.6	1.6
Phase 1 – Grading (2026)	14.9	17.4	2.5	1.5
Phase 1 – Building Construction and Utilities (2026)	9.8	13.0	0.4	0.4
Phase 1 Paving (2026)	7.1	9.9	0.3	0.2
Phase 2 – Interior Construction (2026)	5.3	6.8	0.2	0.2
Phase 2 – Interior Construction (2027)	5.0	6.8	0.2	0.2
Phase 2 – Architectural coating (2027)	0.8	1.1	<0.1	<0.1
Maximum Daily Emissions	*31.6*	*30.2*	*6.5*	*3.9*
SCAQMD Localized Screening Threshold (2.5 acres of disturbance at 25 meters)	131	1,162	8	6
Exceed SCAQMD Threshold?	**No**	**No**	**No**	**No**

1. Maximum emissions may not add up exactly due rounding in the modeling calculations. Detailed emissions calculations are provided in **Attachment D: LST and NAAQS Modeling Data**.
2. South Coast AQMD Rule 403 Fugitive Dust applied for construction emissions. The Rule 403 reduction/credits include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces three times daily; water all haul roads three times daily; and limit speeds on unpaved roads to 15 miles per hour. Reductions percentages from the South Coast AQMD CEQA Handbook (Tables XI-A through XI-E) were applied. No mitigation was applied to construction equipment.

Source: CalEEMod version 2022.1. Refer to **Attachment B: AQ and GHG Modeling Data**.

Operations

This analysis presents the results of the localized dispersion modeling conducted for the Project. The Project's IS/MND used South Coast AQMD's *Mass Rate Localized Significance Threshold (LST) Look-Up Table* to analyze LST impacts. Table 4.3-9 of the IS/MND shows that the Project's

operational emissions would not exceed applicable South Coast AQMD lookup-table LSTs for a five-acre site. Because the emissions generated by the Project are less than those permitted for a smaller site, it is reasonable to assume that the Project would not generate significant localized air quality impacts even though the Project site is 15.8 acres. However, in the interest of even more precise analysis, and to respond to a request by South Coast AQMD, this analysis has been prepared to supplement the LST results based on project-specific dispersion modeling.

The Project's localized operational pollutant concentrations are shown in **Table 12: Localized Operational Emissions**. **Table 12** shows the maximum pollutant concentrations in the Project area from peak day operational activity. These concentrations are the maximum levels and all other modeled locations in the study area would experience lower concentrations (i.e., less of an impact). As shown in **Table 12**, the worst-case unmitigated conditions are well below the applicable thresholds and would not exceed the South Coast AQMD's ambient air quality standards.

Table 12: Localized Operational Emissions

Pollutant	Averaging Time	Maximum Modeled Concentration	Background Concentration (µg/m³) [1]	Total Ground Level Concentration (µg/m³)	Threshold (µg/m³) [2]	Threshold Exceeded?
NO_2 [3]	1-hour	61.34	101.05	162.39	339	No
CO	1-hour	216.24	2,176.66	2,392.89	23,000	No
	8-hour	89.13	1,718.41	1,807.54	10,000	No
PM_{10} [4]	24-hour	0.45	--	0.45	2.5	No
$PM_{2.5}$ [4]	24-hour	0.44	--	0.44	2.5	No

1. Background concentrations are from the Pico-Rivera Monitoring Station (4144 San Gabriel River Pkwy. Pico Rivera, CA 90660, AQS# 060371602).
2. Ambient air quality thresholds are from South Coast AQMD Rule 1303 and Rule 403. All thresholds are shown in micrograms per cubic meter (µg/m³) for comparison to modeled concentrations.
3. NO_2 concentrations were calculated per Tier 2 ARM2 ratios in U.S. EPA's 40 CFR Part 51 Appendix W, § 4.2.3.4. Conversion of NO_X to NO_2 use U.S. EPA minimum and maximum default values NO_2/NO_X of 0.5 and 0.9, respectively.
4. The thresholds for PM10 and PM2.5 are incremental thresholds; therefore, the incremental concentration without background is compared to the threshold.

Source: Refer to **Attachment D: LST and NAAQS Modeling Data.**

6.3 AAQS Modeling Analysis

South Coast AQMD Rule 1303 is part of the District's New Source Review (NSR) permitting program and establishes allowable emissions screening thresholds for new or modified stationary sources of air pollution. For smaller combustion sources (less than or equal to 40 million BTU per hour), the rule provides screening thresholds for NO_X, CO, and PM10. South Coast AQMD does not require modeling for VOC and SO_X. These thresholds are used to determine whether a project's emissions are low enough to be considered insignificant, or if more detailed analysis and potential mitigation are required. As shown in **Table 13**, the Project would not exceed the allowable screening thresholds for CO and PM10 and therefore no further

analysis is required for these pollutants. However, Project emissions would exceed the allowable screening threshold for NO_X, and thus additional analysis is provided herein.

Table 13: Allowable Emissions for Combustion Sources less than or equal to 40 Million BTUs per hour

Scenario	NO_x	CO	PM10
Facility- Wide Emissions (lb/hr)	4.07	8.13	0.18
Screening Threshold (lb/hr)[1]	*1.31*	*72.1*	*7.9*
Exceed Threshold?	**Yes**	**No**	**No**

1. The proposed engines have a heat input capacity of 36.86 million BTUs per hour; therefore, values listed for units greater than 30 but less than 40 million BTUs per hour on Table A-1 from Rule 1303 were utilized.

Source: South Coast AQMD, Rule 1303, https://www.aqmd.gov/docs/default-source/rule-book/reg-xiii/rule-1303-requirements.pdf. Accessed October 8, 2025.
Refer to **Attachment D: LST and NAAQS Modeling Data**.

As requested by South Coast AQMD, dispersion modeling was performed using the South Coast AQMD-preferred model, AERMOD, including building downwash considerations. Emissions were calculated using project-specific emission data and factors described above. The maximum off-site concentrations of NO_2 from Project operations were added to the appropriate historical background concentrations and compared to the applicable AAQS. Consistent with South Coast AQMD Rule 1303(b)(1) and the South Coast AQMD CEQA Air Quality Handbook, if an AAQS is not exceeded, the project is judged to not cause or contribute substantively to an AAQS violation for that pollutant. If a source's maximum impacts are below the applicable significant impact thresholds, the project is judged to not cause or contribute significantly to an AAQS violation or cause an increment violation. As shown in **Table 14: Maximum Off-Site Concentrations from Operations**, maximum emissions from the Project are well below the applicable thresholds and will not cause, or contribute to, a violation of an applicable NO_2 NAAQS or CAAQS.

Table 14: Maximum Off-Site Concentrations from Operations

Pollutant	Averaging Time	Maximum Modeled Concentration ($\mu g/m^3$)	Background Concentration[1] ($\mu g/m^3$)	Total Ground Level Concentration ($\mu g/m^3$)	SCAQMD Threshold ($\mu g/m^3$)[2]	Threshold Exceeded?[3]
NO_2[4]	1-hour	18.40	101.05	119.45	339 (state)	No
	1-hour[5]	15.55	121.38	136.93	188 (federal)	No
	Annual	2.60	31.99	34.59	57 (state)	No
	Annual	2.60	31.99	34.59	100 (federal)	No

1. Background concentrations are from the Pico Rivera Monitoring Station is located at 4144 San Gabriel River Parkway, Los Angeles. https://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year.
2. All thresholds are shown in micrograms per cubic meter ($\mu g/m^3$) for comparison to modeled concentrations.
3. Exceedances of the thresholds are indicated in bold.
4. NO_2 concentrations were calculated per Tier 1 conversion in U.S. EPA's 40 CFR Part 51 Appendix W, Section 4.2.3.4.
5. This comparison is to the federal NAAQS, which is a 98th percentile threshold. The background concentration is the average of the 8th highest daily maximum 1-hour concentration.

Source: Refer to **Attachment D: LST and NAAQS Modeling Data**

7.0 ENERGY ANALYSIS

The analysis below was performed to supplement the IS/MND and reflect adjustments in the design of the Project, as requested by the Lead Agency. Quantifications of construction energy are provided for the adjusted Project below; see **Table 15: Energy Use During Construction**.

Table 15: Energy Use During Construction

Source	Project Construction Usage	Los Angeles County Annual Energy Consumption	Percentage of Countywide Consumption
Electricity Use		**GWh**	
Water Consumption[1]	0.08	68,485	<0.001%
Diesel Use		**Gallons**	
On-Road Construction Trips[2]	35,122	4,129,527,647	0.001%
Off-Road Construction Equipment[3,4]	107,751		0.003%
Construction Diesel Total	142,873		0.004%
Gasoline		**Gallons**	
On-Road Construction Trips[2]	15,211	4,129,744,580	<0.001%

1. Construction water use based on acres disturbed per day per construction sequencing and estimated water use per acre. Water use includes the energy required to convey water to and from the Project Site.
2. On-road mobile source fuel use based on vehicle miles traveled (VMT) from CalEEMod and fleet-average fuel consumption in gallons per mile from EMFAC2021 in Los Angeles County.
3. Off-road mobile source fuel usage based on a fuel usage rate of 0.05 gallons of diesel per horsepower (hp)-hour from USEPA.

Source: Refer to the energy calculations in **Attachment E: Energy Calculations**.

As noted above, the Project design has advanced, and the energy use and diesel use associated with the back-up generators was recalculated to account for the smaller 18 plus 6 redundant Tier 4 generators. Annual Energy use during Project operation is shown in **Table 16: Annual Energy Consumption During Operations**.

Table 16: Annual Energy Consumption During Operations

Source	Project Operational Usage	Los Angeles County Annual Energy Consumption	Percentage Increase Countywide
Electricity Use		**GWh**	
Building Energy[1]	433.62	68,485	0.633%
Water Conveyance	0.06		<0.001%
Diesel Use		**Gallons/Year**	
Emergency Generators[3]	226,800	535,939,687	0.042%

1. Electricity and natural gas usage are based on Project-specific estimates and CalEEMod defaults. The Project during peak load conditions would have a demand of 49.5 MW. The analysis assumes 24/7 operations (8,760 hours per year).
2. The Project is not anticipated to use natural gas.
3. Assumed 18 plus 6 redundant emergency generators each used up to 50 hours per year for testing and maintenance with a 189 gallon per hour fuel flow.

Source: Refer to the energy calculations in **Attachment E: Energy Calculations**.

8.0 NOISE ASSESSMENT

8.1 Methodology

As discussed above, in response to public comments and guidance from the City, the Applicant improved the Project design and modified certain operational characteristics. Accordingly, this Supplemental Technical Analysis has updated noise modeling to analyze the Project adjustments, and included certain elements as requested by commenting agencies. The analysis and conclusions in this Supplemental Technical Analysis for potential noise impacts supplements, and where applicable supersedes, the analysis provided in Section 4.13 of the IS/MND and related Appendix J: Noise and Vibration Analysis Memorandum.

8.2 Operational Noise Analysis

Mechanical Equipment

The noise sources associated with the Project include the operation of the following mechanical equipment: chillers, rooftop mechanical equipment (rooftop units, or RTUs), emergency generators, and substation transformers. A description of this equipment and associated reference noise levels is provided below:

- Chillers: located on the rooftop in the central portion of the data center building. This equipment operates to provide cooling for the servers and related electronic equipment in the building. The rooftop chillers were modeled as point sources in SoundPLAN using sound emission spectrum data from the equipment manufacturer and would be surrounded by a 16-foot-high absorptive noise barrier; see **Attachment F: Noise Data** for modeling information.

- Rooftop Mechanical Equipment (RTUs): RTUs are located on the northern portion of the data center building rooftop and provide support in cooling the data center building. The RTUs were modeled as point sources in SoundPLAN using sound emission spectrum data from the equipment manufacturer; see **Attachment F** for modeling information.

- Emergency Generators: This equipment would be on standby to provide emergency backup power for data center operation in the event of a power failure. Individual generators will also be tested for short durations throughout the year to ensure proper operation, if needed. A total of 24 generators would be located at ground level on the northern façade of the data center building. A total of three (3) emergency generators were modeled as point sources in SoundPLAN to represent periodic testing at various locations throughout the generator yard. Each generator would be equipped with a sound-rated all-weather enclosure capable of achieving an outdoor sound level of 65.3 dBA at 7 meters. It should be noted that the Monterey Park Municipal Code (MPMC) Section 4.50.050 states that emergency generators used during a power outage or other emergency are exempt from the City's noise ordinance; therefore, noise levels

associated with the operation of all 24 generators running simultaneously are excluded from the SoundPLAN modeling. The noise from periodic generator testing, however, was included in modeling to provide a conservative noise analysis. See **Attachment F** for more modeling information.

- Substation Transformers: the Project would include a new substation located in the northeastern portion of the site. Based on site plans, the substation could include up to four 66 kV power transformers that would each generate noise levels up to approximately 75 dBA at one meter.[5] The transformers were modeled as point sources in the central portion of the proposed substation area. See **Attachment F** for more modeling information

SoundPLAN Modeling Results

To evaluate the propagation of sound each of the stationary noise sources discussed above were modeled in SoundPLAN to determine the mechanical equipment sound levels associated with the refined Project. SoundPLAN allows computer simulations of noise situations, and creates noise contour maps using reference noise levels, topography, point and area noise sources, mobile noise sources, and intervening walls and structures. Utilizing the reference noise level data described above, as well as the proposed building locations/heights and acoustically relevant buildings in the surrounding area, SoundPLAN was used to calculate composite noise levels (i.e., the combined noise levels from all mechanical equipment) at the nearest sensitive receptors surrounding the Project Site. The modeled noise levels are provided in **Table 17: Mechanical Equipment Noise Levels**, and the modeled noise contours are provided in **Attachment F**.

Table 17: Mechanical Equipment Noise Levels

Receptor No.[1]	Land Use	Highest Modeled Noise Level (dBA L_{50})	Daytime Noise Standard (dBA L_{50})[2]	Exceeds Standard?	Nighttime Noise Standard (dBA L_{50})[2]	Exceeds Standard?
1	Residential (northeast)	52.0	61	No	56	No
12	Residential (west)	48.6	56	No	54	No

1. **See Attachment F** for modeled receptor locations. The nearest residential receptors with the highest modeled noise levels are provided for reporting purposes. All other residential receptors would experience lower noise levels than those shown.
2. The measured ambient noise levels exceed the MPMC noise standards. Therefore, the measured ambient noise level becomes the noise standard in accordance with MPMC Section 4.50.080(a). See the noise measurement data and established noise standards from the *Exterior Noise and Exterior Façade Acoustical Analysis* (Veneklasen Associates, 2024), and *1977 Saturn Data Center Project Noise and Vibration Analysis* (Kimley-Horn, September 3, 2024).

Source: See **Attachment F** for complete noise modeling data and results.

[5] National Electrical Manufactures Association, *Transformers, Regulators, and Reactors TR 1-2013*, 2019.

As indicated in **Table 17**, Project-generated noise levels at the nearest residential receptors would reach up to 52.0 dBA and 48.6 dBA, respectively, and would not exceed the City's established noise standards. Similarly, the level of noise generated by the Project is less than the ambient levels of noise in the existing environmental based on the daytime and nighttime noise measurements taken at locations around the Project Site and the modeled composite operational noise levels associated with the Project. It should also be noted that the MPMC does not contain a noise measurement methodology, or quantitative decibel-based criteria, that determines a level of significance for noise level increases. Nonetheless, the increase in the level of noise that will result from the Project would not exceed the City's noise level standards. In addition, noise from the Project would not result in substantial noise increases and is expected to be barely perceptible and negligible based on industry standard noise characteristics and acoustical factors. The Project would not generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance. Therefore, operational noise impacts would remain less than significant, as identified in the IS/MND.

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%

Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
General Office Building	0.00	0%
Parking Lot	0.61	100%
General Office Building	0.00	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	0.00	532	0.03	< 0.005
2026	0.00	532	0.03	< 0.005
2027	0.00	532	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat
Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A

Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3
Pesticides	36.2
Toxic Releases	81.8
Traffic	97.9
Effect Indicators	—
CleanUp Sites	68.9
Groundwater	0.00
Haz Waste Facilities/Generators	60.2
Impaired Water Bodies	0.00
Solid Waste	0.00
Sensitive Population	—
Asthma	17.4
Cardio-vascular	7.94
Low Birth Weights	49.3
Socioeconomic Factor Indicators	—
Education	66.5
Housing	54.1
Linguistic	71.2
Poverty	43.7
Unemployment	77.1

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	40.31823431
Employed	23.22597203
Median HI	54.35647376
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	63.0
Healthy Places Index Score for Project Location (b)	48.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Square footage according to project description.
Construction: Construction Phases	Changes according to client's project construction schedule
Construction: Off-Road Equipment	anticipated construction equipment based on assumptions

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	16.2	annual days of extreme heat
Extreme Precipitation	5.55	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2

Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.7
AQ-PM	83.4
AQ-DPM	56.8
Drinking Water	85.4
Lead Risk Housing	89.3
Pesticides	36.2
Toxic Releases	81.8

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	63.0
Healthy Places Index Score for Project Location (b)	48.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

Operations		
Residential	0.0094	0.0019
Worker	0.0061	0.0012
SCAQMD Threshold	*N/A*	*1*
Threshold Exceeded?	N/A	No

[1] Refer to Appendix A. According to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system.

[2] The reported pollutant concentration is at the closest receptor (maximally exposed individual receptor).

REL (DPM): 5

Hazard Index = Ci/RELi

Risk Parameters

Phase I Construction/Operations Only (Start 3rd Tri)

- - - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for    24 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   9830000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
```

```
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:     24 Source(s);       2 Source Group(s); and     603
Receptor(s)

                with:     24 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      0 AREA type source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    58.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.6 MB of RAM.

 **Input Runstream File:          aermod.inp

Attachment D: LST and NAAQS Modeling Data

LST

Generators ID	Rating Size	Unit	Max Hourly (gal/hr)	Pollutant	Emission Factor (lb/kw-hr)	Peak Hourly Emissions (lb/hr)	Peak Hourly Emissions (g/s)	Daily (g/s)
EG01-24	2750	kW	265.8	NO_x (1hr)	0.001478201	4.0651	0.5122	-
				CO (1-hr)	0.002956401	8.1301	1.0244	-
				CO (8-hr)	0.002956401	8.1301	1.0244	-
				PM10 (24-hr)	6.50408E-05	0.1789	0.0225	0.0003
				PM2.5 (24-hr)	6.50408E-05	0.1789	0.0225	0.0073

1-hr pollutants 3 engines @ peak hour at the same time and variable hours 6am-7pm (13 hours)
8-hr pollutant 3 engines - same as 1 hr
24-hr - the peak rate x 4.2 hours divide by 13 hours and put that in for all 24 engines still at 6am-7pm (13 hours)

NAAQS

Generators ID	Rating Size	Unit	Operating Time (hr/yr/unit)	Pollutant	Emission Factor (lb/kw-hr)	Peak Hourly Emissions (lb/hr)	Average Hourly Emissoins (lb/hr)	Peak Hourly Emissions (g/s)	Average Hourly Emissions (g/s)
EG01-24	2750	kW	200	NO_X	0.001478201	4.0651	0.0928	0.5122	0.0117

Table A-1

Allowable Emissions
for Noncombustion Sources and for
Combustion Sources less than or equal to 40 Million BTUs per hour

Heat Input Capacity (million BTUs/hr)		NO_x (lbs/hr)	CO (lbs/hr)	PM_{10} (lbs/hr)
Noncombustion Source		0.068	3.7	0.41
	< 2	0.20	11.0	1.2
>2	< 5	0.31	17.1	1.9
>5	< 10	0.47	25.9	2.8
>10	< 20	0.86	47.3	5.2
>20	< 30	1.26	69.3	7.6
>30	≤40	1.31	72.1	7.9

Engine Specs	265.8	gal/hr
	0.1387	Convesion
	36.86646	mmbtu/hr

Screening Analysis

Compare the emissions from the source you are applying for to those in Table A-1. If the emissions are less than the allowable emissions, no further analysis is required. If the emissions are greater than the allowable emissions, a more detailed air quality modeling analysis is required.

Emission Factor (Controlled)						
	VOC	NO_x	CO	SO_2	PM_{10}	$PM_{2.5}$
g/hp-hr	0.140	0.500	1.000	0.006	0.022	0.022
g/kw-hr	0.188	0.671	1.341	0.007	0.030	0.030
lb/kw-hr	0.00041	0.00148	0.00296	0.00002	0.00007	0.00007
lb/hr	1.13821	4.07	8.13	0.04472	0.17886	0.17886

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   291 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   9830000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Accepts FLAGPOLE Receptor . Heights.
      * The User Specified a Pollutant Type of: CO

 **Model Calculates  2 Short Term Average(s) of:   1-HR   8-HR

 **This Run Includes:    291 Source(s);       3 Source Group(s); and     608
Receptor(s)
```

```
                with:      3 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    288 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    58.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      4.7 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   SATURN_CO.ERR

 **File for Summary of Results:   C:\LAKES\AERMOD VIEW\SATURN_CO\SATURN_CO.SUM

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Full Conversion Assumed for NO2.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   291 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   9830000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Accepts FLAGPOLE Receptor . Heights.
```

```
      * The User Specified a Pollutant Type of: NO2

 **Note that special processing requirements apply for the 1-hour NO2 NAAQS - check
available guidance.
   Model will process user-specified ranks of daily maximum 1-hour values averaged
across the number of years modeled.
   For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values can be
simulated using the MULTYEAR keyword.
   Multi-year PERIOD and 1-hour values should only be done in a single model run
using the MULTYEAR option with a
   single multi-year meteorological data file using STARTEND keyword.

 **Model Calculates  1 Short Term Average(s) of:   1-HR

 **This Run Includes:    291 Source(s);       3 Source Group(s); and     608
Receptor(s)

                with:      3 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    288 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)
          Model Outputs External File(s) of Maximum Daily 1-hr Values by Day
(MAXDAILY Keyword)
          Model Outputs External File(s) of Maximum Daily 1-hr Values by Year
(MXDYBYYR Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours
```

                                          ***     MODEL SETUP OPTIONS SUMMARY
  ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Allows User-Specified Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
```

```
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Full Conversion Assumed for NO2.
      * Model Uses URBAN Dispersion Algorithm for the SBL for    24 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   9830000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: NO2

 **Note that special processing requirements apply for the 1-hour NO2 NAAQS - check
available guidance.
   Model will process user-specified ranks of daily maximum 1-hour values averaged
across the number of years modeled.
   For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values can be
simulated using the MULTYEAR keyword.
   Multi-year PERIOD and 1-hour values should only be done in a single model run
using the MULTYEAR option with a
   single multi-year meteorological data file using STARTEND keyword.

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates ANNUAL Averages

 **This Run Includes:     24 Source(s);       2 Source Group(s); and     603
Receptor(s)

                with:     24 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
```

Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by Day (MAXDAILY Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by Year (MXDYBYYR Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 58.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ;
Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.8 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: Saturn_NAAQS.err

**File for Summary of Results: Saturn_NAAQS.sum
